

Design Patterns

1

Design Pattern

- Definition
 - A named general reusable solution to common design problems
 - Used in Java libraries
- Major source: GoF book 1995
 - "Design Patterns: Elements of Reusable Object-Oriented Software"
 - 24 design patterns

N. Meng, B. Ryder

2

2

Purpose-based Pattern Classification

- **Creational**
 - About the process of object creation
- **Structural**
 - About composition of classes or objects
- **Behavioral**
 - About how classes or objects interact and distribute responsibility

N. Meng, B. Ryder

3

3

Design pattern space

		Purpose		
		Creational	Structural	Behavioral
Scope	Class	Factory Method (107)	Adapter (class) (139)	Interpreter (243) Template Method (325)
	Object	Abstract Factory (87) Builder (97) Prototype (117) Singleton (127)	Adapter (object) (139) Bridge (151) Composite (163) Decorator (175) Facade (185) Flyweight (195) Proxy (207)	Chain of Responsibility (223) Command (233) Iterator (257) Mediator (273) Memento (283) Observer (293) State (305) Strategy (315) Visitor (331)

N. Meng, B. Ryder

4

4

Adapter Pattern

- Problem: incompatible interfaces
- Solution: create a wrapper that maps one interface to another
 - Key point: neither interface has to change and they execute in decoupled manner

N. Meng, B. Ryder

5

5

Example

Client

*Abstract
Server*
foo()

ZServer
bar(int)

- Problem
 - Client written against some defined interface
 - Server with the right functionality but with a different interface
- Options
 - Change the client
 - Change the server
 - Create an adapter to wrap the server

N. Meng, B. Ryder

6

6

Example

N. Meng, B. Ryder

7

7

Sample Java Code

```

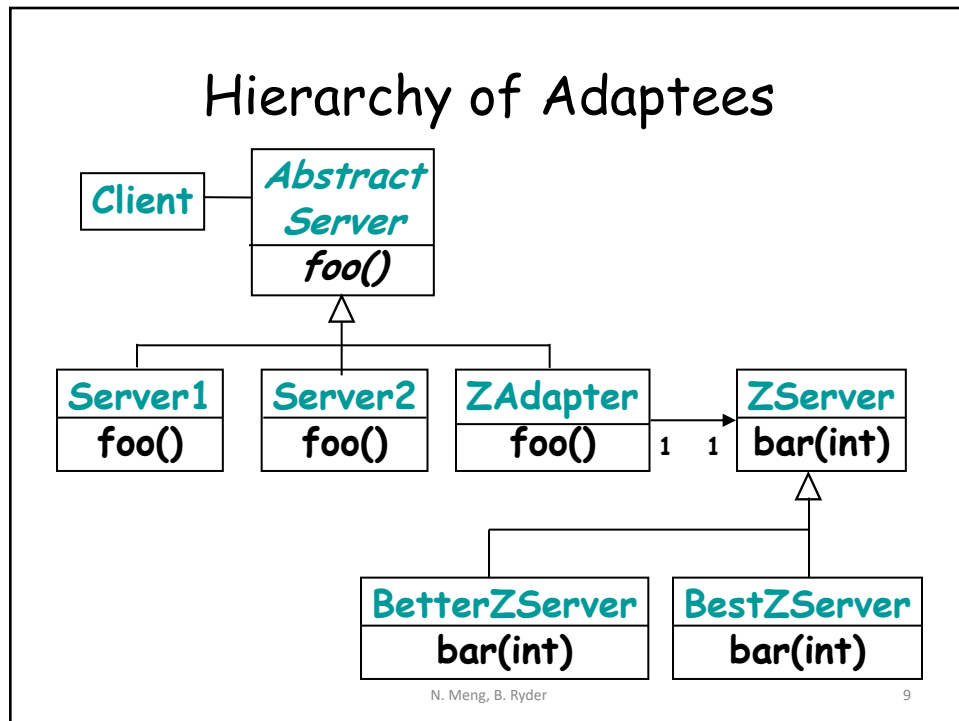

abstract class AbstractServer { abstract void foo(); }
class ZAdapter extends AbstractServer {
    private ZServer z;
    public ZAdapter() { z = new ZServer(); }
    public void foo() { z.bar(5000); }
    //wrap call to ZServer method
}
...
somewhere in client code:
AbstractServer s = new ZAdapter();
  
```

N. Meng, B. Ryder

8

8

Hierarchy of Adaptees

9

Sample Java Code

```

abstract class AbstractServer
{ abstract void foo(); }
class ZAdapter extends AbstractServer {
    private ZServer z;
    public ZAdapter(int perf) {
        if (perf > 10) z = new BestZServer();
        else if (perf > 3) z = new BetterZServer();
        else z = new ZServer();
    }
    public void foo() { z.bar(5000); }
}
  
```

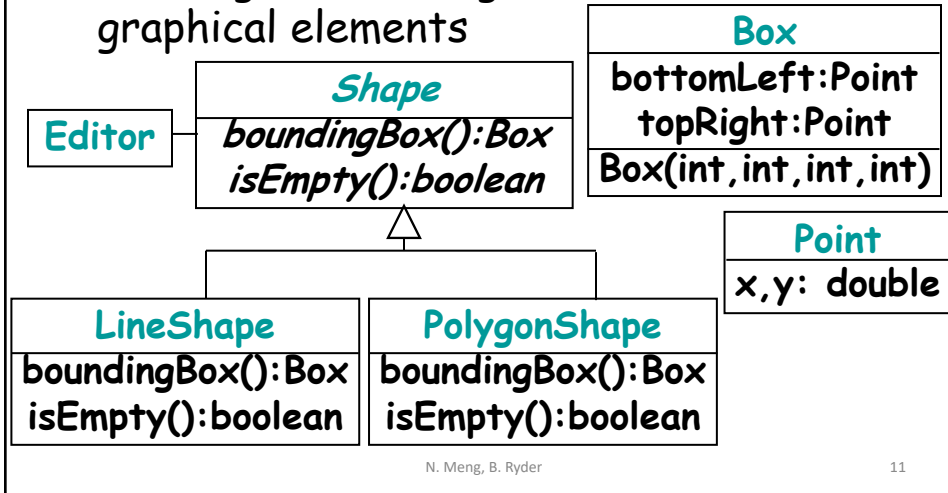

N. Meng, B. Ryder

10

10

Another Adapter Example

- Drawing editor: diagrams built with graphical elements

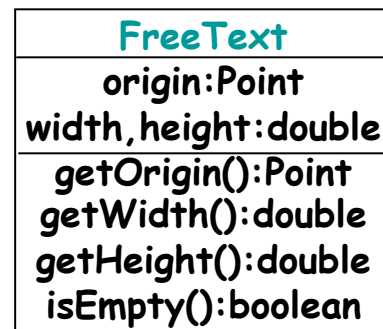

11

11

Adding TextShape

- Problem: mismatched interfaces
- Solution: create a **TextShape** adapter

N. Meng, B. Ryder

12

12

Sample Java Code

```
class TextShape implements Shape {
    private FreeText t;
    public TextShape() { t = new FreeText(); }
    public boolean isEmpty() { return t.isEmpty(); }
    public Box boundingBox() {
        int x1 = toInt(t.getOrigin().getX());
        int y1 = toInt(t.getOrigin().getY());
        int x2 = toInt(x1 + t.getWidth());
        int y2 = toInt(y1 + t.getHeight());
        return new Box(x1,y1,x2,y2); }
    private int toInt(double) { ... } }
```

N. Meng, B. Ryder

13

13

Pluggable Adapters

- Preparation for future adaptation
 - Define a narrow interface
- Future users of our code will write adapters to implement the interfaces
 - E.g., ITaxCalculator

N. Meng, B. Ryder

14

14

Factory Pattern

- Problem: there are many ways to create certain objects
- Solution: create a framework that is responsible for creating the objects
 - Key point: clients do not know details about object creation

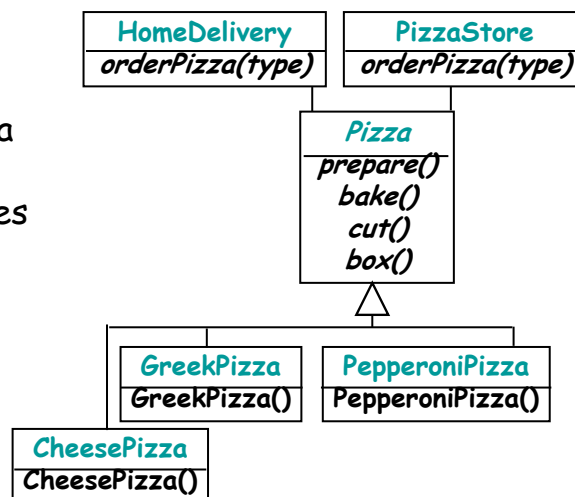

N. Meng, B. Ryder

15

15

Example

- Problem
 - Clients invoke different pizza constructors
 - New pizza types may be added
 - Clam, Veggie
 - Original pizza types may be removed
 - Greek

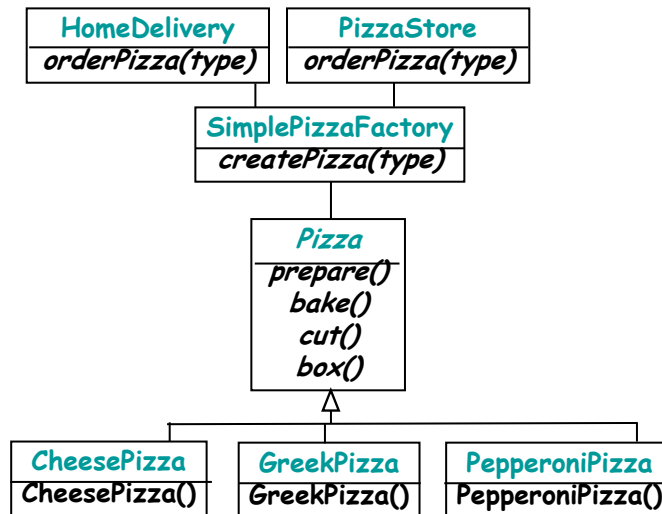

N. Meng, B. Ryder

16

16

Solution: Encapsulate object creation

N. Meng, B. Ryder

17

17

Sample Java Code

```

public class PizzaStore {
    SimplePizzaFactory factory;
    public PizzaStore(SimplePizzaFactory factory) {
        this.factory = factory;
    }
    public Pizza orderPizza(String type) {
        Pizza pizza = factory.createPizza(type);
        pizza.prepare();
        pizza.bake();
        pizza.cut();
        pizza.box();
        return pizza;
    }
}
  
```

N. Meng, B. Ryder

18

18

```

public class SimplePizzaFactory {
    public Pizza createPizza(String type) {
        Pizza pizza = null;
        if (type.equals("cheese")) {
            pizza = new CheesePizza();
        } else if (type.equals("pepperoni")) {
            pizza = new PepperoniPizza();
        } else if (type.equals("clam")) {
            pizza = new ClamPizza();
        } else if (type.equals("veggie")) {
            pizza = new VeggiePizza();
        }
    }
    return pizza;
}

```

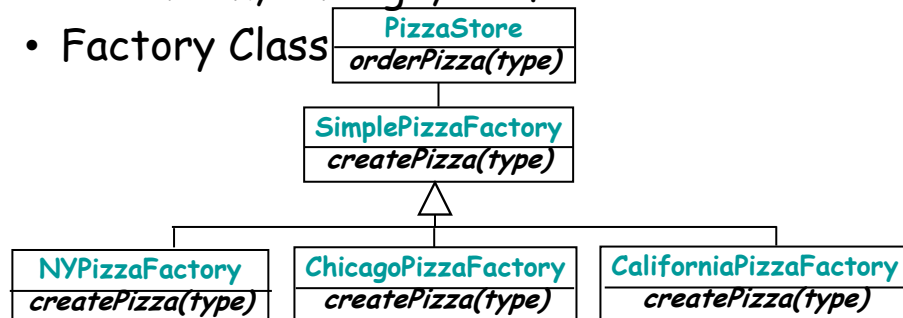

N. Meng, B. Ryder

19

19

Different Styles of Pizza?

- New York, Chicago, California
- Factory Class

N. Meng, B. Ryder

20

20

An Alternative Approach: Factory Method

N. Meng, B. Ryder

21

21

Sample Code

```

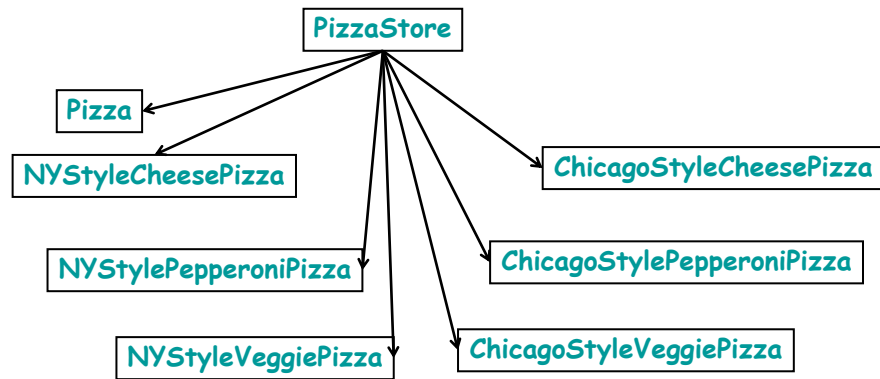

public abstract class PizzaStore {
    public Pizza orderPizza(String type) {
        Pizza pizza = createPizza(type);
        pizza.prepare();
        ... ..
    }
    abstract Pizza createPizza(String type);
}
  
```

N. Meng, B. Ryder

22

22

The Original Object Dependencies

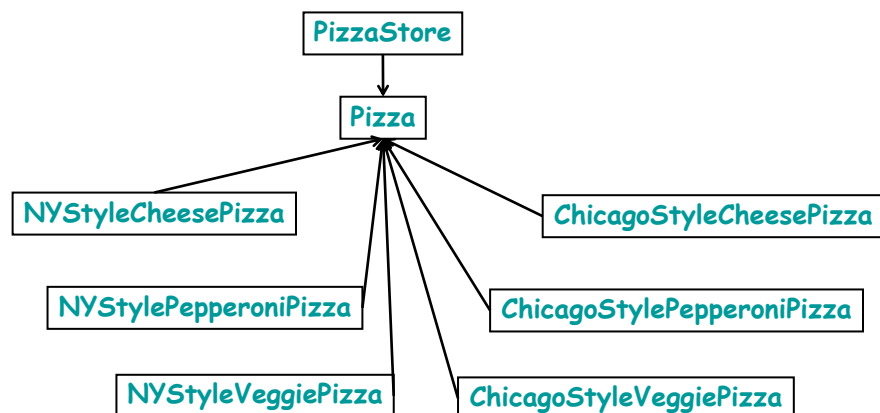

N. Meng, B. Ryder

23

23

With Factory Pattern

N. Meng, B. Ryder

24

24

Factory Pattern

- The Dependency Inversion Principle
 - Depend upon abstractions instead of concretizations.
 - Use the pattern when
 - a class cannot anticipate the class of objects it will create
 - A class wants its subclasses to specify the objects to create

N. Meng, B. Ryder

25

25

Iterator Pattern

- Problem
 - There are lots of ways to stuff objects into a collection
 - Array, stack, list, hashmap, ...
 - When clients want to iterate over those objects, you don't want to expose data structure implementation

N. Meng, B. Ryder

26

26

Example: Diner and Pancake House Merge

- The Pancake House menu will serve as the breakfast menu
- The Diner's menu will serve as the lunch menu

PancakeHouseMenu
<i>ArrayList<MenuItem> menuItems</i>
<i>getMenuItems()</i>
<i>addItem(name, desc, isVeg, price)</i>

DinerMenu
<i>MenuItem[] menuItems</i>
<i>getMenuItems()</i>
<i>addItem(name, desc, isVeg, price)</i>

N. Meng, B. Ryder

27

27

Problem: A Java-Enabled Waitress

Waitress
<i>printMenu()</i>
<i>printBreakfastMenu()</i>
<i>printLunchMenu()</i>
<i>printVegetarianMenu()</i>
<i>isItemVegetarian(name)</i>

N. Meng, B. Ryder

28

28

```

printMenu() {
    for (int i = 0; i < breakfastItems.size(); i++) {
        MenuItem menuItem = breakfastItems.get(i);
        System.out.print(menuItem.getName() + " ");
        System.out.println(menuItem.getPrice() + "");
        System.out.println(menuItem.getDescription());
    }
    for (int i = 0; i < lunchItems.length; i++) {
        MenuItem menuItem = lunchItems[i];
        System.out.print(menuItem.getName() + " ");
        System.out.println(menuItem.getPrice() + "");
        System.out.println(menuItem.getDescription());
    }
}

```

N. Meng, B. Ryder

29

29

- Problem: We always need to know the internal data structure of both menus to iterate through them
- Solution: Decouple the Waitress from the concrete implementations

```

Iterator iterator = breakfastMenu.createIterator();
while (iterator.hasNext()) {
    MenuItem menuItem = iterator.next(); ...
}
iterator = lunchMenu.createIterator();
while (iterator.hasNext()) {
    MenuItem menuItem = iterator.next(); ...
}

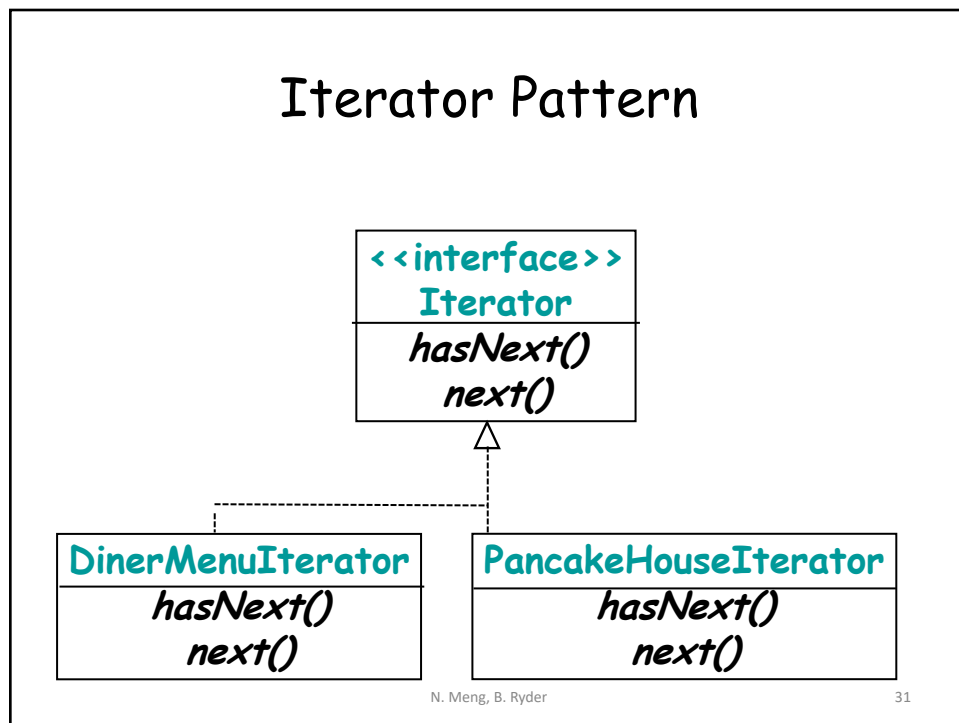

```

N. Meng, B. Ryder

30

30

Iterator Pattern

31

Integrate Iterator with Menus

```

public class DinerMenu {
    public Iterator createIterator() {
        return new DinerMenuIterator(menuItems);
    }
}

public class DinerMenuIterator implements Iterator {
    MenuItem[] items;
    int position = 0;
    public DinerMenuIterator(MenuItem[] items) {
        this.items = items;
    }
    public MenuItem next() {
        MenuItem menuItem = items[position];
        position = position + 1;
        return menuItem;
    }
    public boolean hasNext() {
        if (position >= items.length || items[position] == null) {
            return false;
        } else {
            return true;
        }
    }
}
  
```

N. Meng, B. Ryder

32

32

Fix up the Waitress Code

```

public void printMenu() {
    Iterator pancakeIterator =
        pancakeHouseMenu.createIterator();
    Iterator dinerIterator = dinerMenu.createIterator();
    printMenu(pancakeIterator);
    printMenu(dinerIterator);
}

private void printMenu(Iterator iterator) {
    while(iterator.hasNext()) {
        MenuItem menuItem = iterator.next();
        System.out.print(menuItem.getName() + ", ");
    }
}

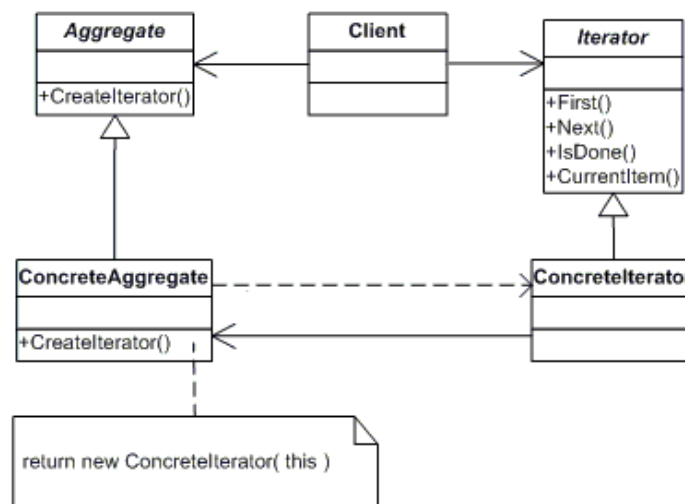

```

N. Meng, B. Ryder

33

33

General Form

N. Meng, B. Ryder

34

34

Other Examples

- `java.util.ArrayList`: subclass of `AbstractList`
- Interface `java.util.Iterator`
- Interface `java.util.Iterable`

N. Meng, B. Ryder

35

35

```
public class SList<Type> implements Iterable<Type> {
    private Type[] arrayList;
    private int currentSize;
    public SList(Type[] newArray) {
        arrayList = newArray;
        currentSize = arrayList.length;
    }
    @Override public Iterator<Type> iterator() {
        Iterator<Type> it = new Internator<Type>() {
            private int currentIndex = 0;
            @Override public boolean hasNext() {...}
            @Override public Type next() {...}
            @Override public void remove() {...}
        }; return it;}}

```

N. Meng, B. Ryder
