

## Common Categories

<u>Category</u>	<u>Examples</u>
Physical objects	Register, Airplane
Places	Store, Airport
Transactions	Sale, Payment, Reservation
Roles of people	Cashier, Manager
Scheduled Events	Meeting, Flight
Records	Receipt, Ledger
Specifications and descriptions	FlightDescription, ProductSpecification
Catalogs of descriptions	ProductCatalog

N. Meng, B. Ryder

13

### Example: Simplified "Process Sale"

No credit cards, no taxes, no external accounting system, no external inventory system, ...

- Customer arrives with goods
- Cashier starts a new sale

Possible conceptual classes: **Customer**, **Cashier**, **Item** (i.e., goods), **Sale**

N. Meng, B. Ryder

14

## Simplified "Process Sale", cont.

- Cashier enters item ID
- System records sale line item and presents item description, price, and running total
- In the end, cashier tells customer the total and asks for payment

Possible conceptual classes: **SalesLineItem**, **ProductSpecification** (description + price + item ID), **Payment**

N. Meng, B. Ryder

15

## Simplified "Process Sale", cont.

- Cashier enters amount tendered (cash)
- System presents change due, and releases cash drawer
- Cashier deposits cash and returns change
- System presents receipt

Possible conceptual classes:  
**Register** (implied by cash drawer), **Receipt**

N. Meng, B. Ryder

16

## Simplified "Process Sale", cont.

- Want a completely integrated system
  - **Store**: has the items and the registers
  - **ProductCatalog**: stores the product specifications for all items
  - **Manager**: starts all the registers in the morning
    - Need this for the initial implementation: to be able to start up the system
- There is no "correct solution"
  - Somewhat arbitrary collection of concepts

N. Meng, B. Ryder

17

## Possible Initial Domain Model

- Just the conceptual classes
- May evolve as more scenarios are explored

N. Meng, B. Ryder

18

## Step 2: Decide Attributes

- Properties of the conceptual classes relevant to the problem domain
  - Nouns and noun phrases that the requirements suggest or imply a need to remember
  - E.g., description, price, item ID relevant to **ProductSpecification**
  - E.g., change, amount relevant to **Receipt**

N. Meng, B. Ryder

19

## A Common Mistake

- Example

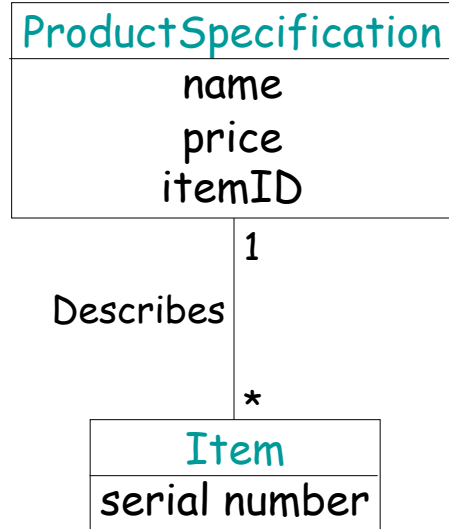

*“If we do not think of some conceptual class  $X$  as a number or text in the real world,  $X$  is probably a conceptual class, not an attribute.” [Larman p. 146]*

N. Meng, B. Ryder

20

## Which Alternative Is Better?

N. Meng, B. Ryder

21

## Description Class

- Definition
  - It contains information that describes something else.
  - **ProductDescription** records the price, picture, and text description of an **Item**
- When do we need it?

N. Meng, B. Ryder

22

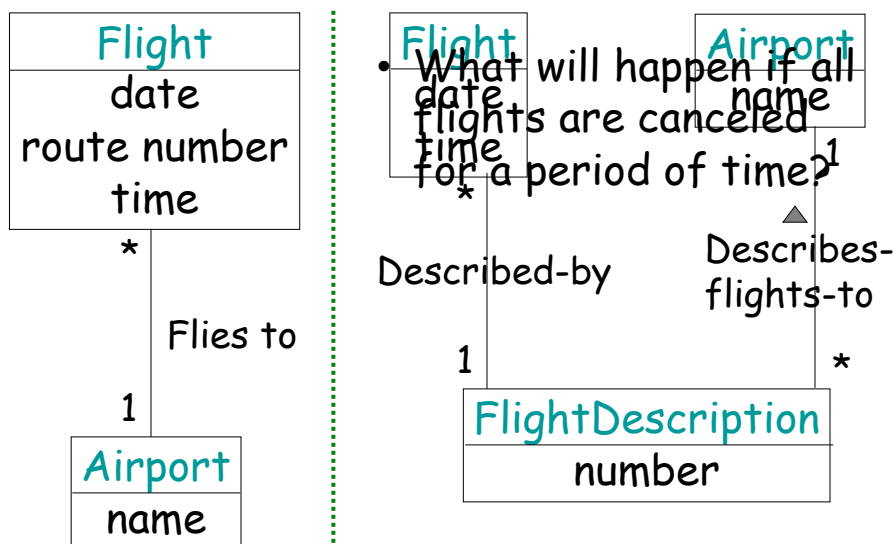

## We need a **Description Class** instead of **attributes** for a thing when

- The description exists independently of the current existence of the thing
  - Deleting things will not cause description loss
  - Adding things will not cause description redundancy

N. Meng, B. Ryder

23

## Another Example

N. Meng, B. Ryder

24

## Step 3: Identify Associations

- Relationship between instances of conceptual classes
- Think of it as a mathematical **relation**
  - Typically a binary relation:  $R \subseteq S1 \times S2$
  - $S1$  = set of instances of the first class
  - $S2$  = set of instances of the second class

N. Meng, B. Ryder

25

## Typical Associations

- **A is a physical/logical part of B**
  - Wing-Airplane, SalesLineItem-Sale, FlightLeg-FlightRoute, Finger-Hand
- **A is physically/logically contained in B**
  - Item-Shelf, Passenger-Airplane, Flight-FlightSchedule
- **A is recorded/reported/captured in B**
  - Sale-Register, Reservation-FlightManifest
- **A is a description of B**
  - ProductSpecification-Item

N. Meng, B. Ryder

26

## Typical Associations

- A uses or manages B
  - Cashier-Register, Pilot-Airplane
- A is related to a transaction B
  - Customer-Payment, Payment-Sale, Reservation-Cancellation
- A is owned by B
  - Airplane-Airline

N. Meng, B. Ryder

27

## Finding Associations

- Consider the typical categories
  - Larman, Ch 9 p 155
- Focus on associations that are **relevant with respect to the use cases**
  - Don't create too many associations - common problem

N. Meng, B. Ryder

28

## Multiplicity

- Range:  $x..y$
- Common notation for ranges
  - $x..x \rightarrow x$
  - $x..infinity \rightarrow x..*$
  - $0..infinity \rightarrow *$
- Combination of ranges
  - $x..y, z..w$
  - e.g. "2,4"  $\rightarrow$  number of doors in a car
- **Most common multiplicities:  $*$ ,  $1..*$ ,  $0..1$ ,  $1$**

N. Meng, B. Ryder

29

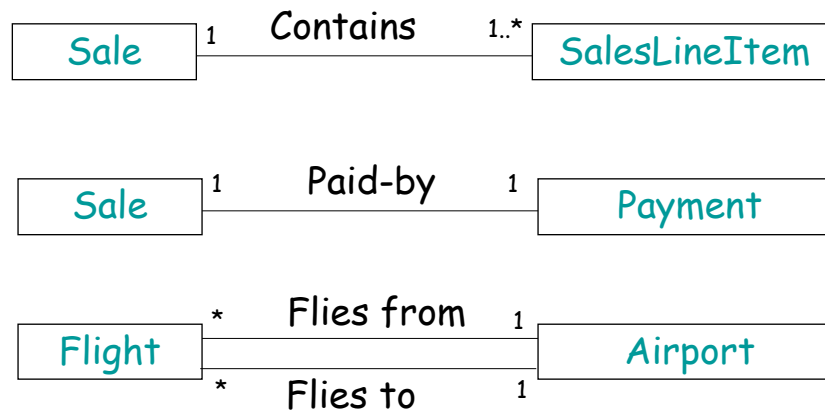

## Association Examples

- SalesLineItem-Sale
  - A sale contains lines of sale items
- Payment-Sale
  - A payment is always related to a sale
- Flight-Airport
  - A flight flies from an airport and to another airport

N. Meng, B. Ryder

30

## Domain Models

N. Meng, B. Ryder

31

## A Complicated Example

- A store uses a set of external authorization services for payments

- Each service associates a **merchant ID** with the store
  - For each service, different stores have different **merchant IDs**
  - Each store has different **merchant IDs** for different services

N. Meng, B. Ryder

32

## Where Should the **merchantID** Be Located?

Option 1

Option 2

**Neither**

N. Meng, B. Ryder

33

## Association Class

- **merchantID** is conceptually related to the association, not to either Store or Service
- Solution: **association class** to hold attributes of the association

N. Meng, B. Ryder

34

## When to Use Association Classes?

- When an attribute “doesn't fit” in the classes participating in an association
- When the lifetime of the attribute depends on the lifetime of the association
- Often used with many-to-many associations

N. Meng, B. Ryder

35

## Many-to-Many Association

- A company may employ several persons
- A person may be employed by several companies
- Attributes: salary, starting date, ...

N. Meng, B. Ryder

36
