

**READ THIS NOW!**

- Print your name in the space provided below. Code Form **B** on your OpScan. Check your SSN and Form Encoding!
- Choose the single best answer for each question — some answers may be partially correct. If you mark more than one answer, it will be counted wrong.
- Unless a question involves determining whether given C++ code is syntactically correct, assume that it is valid. The given code has been compiled and tested, except where there are deliberate errors. Unless a question specifically deals with compiler #include directives, you should assume the necessary header files have been included.
- Be careful to distinguish integer values from floating point (real) values (containing a decimal point). In questions/answers which require a distinction between integer and real values, integers will be represented without a decimal point, whereas real values will have a decimal point, [ 1704 (integer), 1704.0 (real)].
- The answers you mark on the OpScan form will be considered your official answers.
- When you have completed the test, sign the pledge at the bottom of this page and turn in the test.
- This is a closed-book, closed-notes examination. No calculators or other electronic devices may be used during this examination. You may not discuss (in any form: written, verbal or electronic) the content of this examination with any student who has not taken it. You must return this test form when you complete the examination. Failure to adhere to any of these restrictions is an Honor Code violation.
- There are 25 questions, equally weighted. The maximum score on this test is 100 points.

**Do not start the test until instructed to do so!**

Print Name (Last, First) \_\_\_\_\_

**Pledge:** On my honor, I have neither given nor received unauthorized aid on this examination.

## I. Recursion

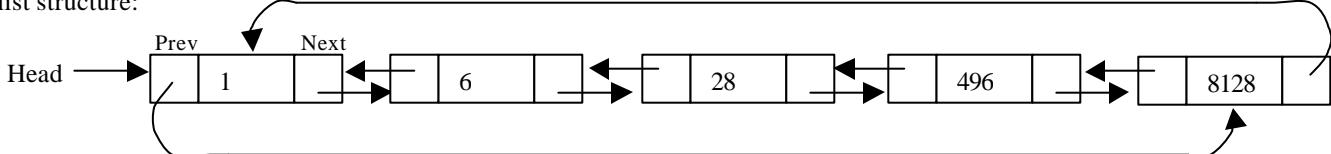

Consider the linked list class and list node declarations given below:

```
class ItemType {
private:
    int Value;
public:
    ItemType();
    ItemType(int newValue);
    void setValue(int newValue);
    int getValue() const;
};

class LinkNode {
private:
    ItemType Data;
    LinkNode *Next, *Prev;
public:
    LinkNode();
    LinkNode(ItemType newData);
    bool setNext(LinkNode* newNext);
    bool setPrev(LinkNode* newPrev);
    bool setData(ItemType newData);
    ItemType getData() const;
    LinkNode* getNext() const;
    LinkNode* getPrev() const;
};

LinkNode *Head;
```

Assume that the member functions above have been implemented correctly to carry out their intended task. Given the initial list structure:

1. What is the value returned by the call `cout << test2(Head, Head->getPrev());` to the following recursive function:

```
int test2 (LinkNode *L, LinkNode *R) {
    if ( (L == NULL) || (R == NULL) ) return 0;
    else if (L->getData().getValue() == R->getData().getValue())
        return (R->getData().getValue());
    else {
        int left = L->getData().getValue();
        int right = R->getData().getValue();
        int Lsum = test2(L->getNext(), R->getPrev());
        int Rsum = test2(R->getPrev(), L->getNext());
        return( left + Lsum + Rsum + right );
    }
}
```

- |         |          |                       |
|---------|----------|-----------------------|
| 1) 28   | 5) 17318 | 9) 51954              |
| 2) 531  | 6) 25977 | 10) None of the above |
| 3) 8128 | 7) 34636 |                       |
| 4) 8659 | 8) 43295 |                       |

**I. Recursion (continued)**

2. The execution of a recursive function results in activation records for the function being created and stored where?

- |                  |                      |
|------------------|----------------------|
| 1) Heap          | 4) Text Segment      |
| 2) Runtime Stack | 5) Data Segment      |
| 3) Registers     | 6) None of the above |

For the next two questions, consider the following recursive function:

```
int Lie( int i )
{
    if (i < 9)
        return( 13 ) ;
    else if (i < 10)
        return( 21 ) ;
    else
        return( Lie(i-2) + Lie(i-1) ) ;

} // Lie
```

3. What is returned from the call: `Lie (15)`? (*Hint: don't do the same work twice.*)

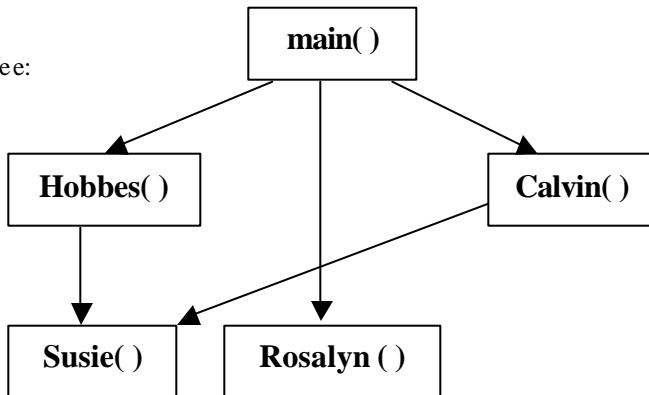

- |                       |        |        |
|-----------------------|--------|--------|
| 1) 13                 | 4) 55  | 7) 233 |
| 2) 21                 | 5) 89  | 8) 377 |
| 3) 34                 | 6) 144 | 9) 610 |
| 10) None of the above |        |        |

4. Not counting the original call, how many recursive calls are made by the execution of: `Lie (15)`?

- |                       |       |       |
|-----------------------|-------|-------|
| 1) 1                  | 4) 5  | 7) 21 |
| 2) 2                  | 5) 8  | 8) 34 |
| 3) 3                  | 6) 13 | 9) 55 |
| 10) None of the above |       |       |

## II. Separate Compilation

Consider the function call tree:

Assume that the software system is to be decomposed for compilation into three separate source files: `main.cpp`, `Calvin.cpp`, and `Susie.cpp`, and accompanying header files of the same names. The function definitions are to be placed in the various cpp files as shown below along with the corresponding code for the files.

FN definition locations

Definition for:	Goes in:
<code>main( )</code>	<code>main.cpp</code>
<code>Rosalyn( )</code>	<code>main.cpp</code>
<code>Calvin( )</code>	<code>Calvin.cpp</code>
<code>Hobbes( )</code>	<code>Calvin.cpp</code>
<code>Susie( )</code>	<code>Susie.cpp</code>

Scott separate compilation unit

```

//Calvin.h
void Calvin ( /* parameters */ );
// Calvin.cpp
#include "Calvin.h"
void Hobbes( /* parameters */ );

void Calvin ( /* parameters */ ){
// Calvin's code
    Susie();
}

void Hobbes ( /* parameters */ ){
// Hobbes's code
    Susie();
}
  
```

Susie separate compilation unit

```

//Susie.h
void Susie ( /* parameters */ );
// Susie.cpp
#include "Susie.h"

void Susie ( /* parameters */ ){
// Susie's code
}
  
```

main separate compilation unit

```

//main.h
/* main declarations */

//main.cpp
#include "main.h"
void Rosalyn ( /* parameters */ );

void main() {

    Hobbes ( /* parameters */ );
    Rosalyn ( /* parameters */ );
    Calvin ( /* parameters */ );
}

void Rosalyn ( /* parameters */ ){
// Rosalyn's code
}
  
```

		}
--	--	---

## II. Separate Compilation (*continued*)

Assume that there are no global type and no global constant declarations, (and also no global variables of course). Answer the following questions with respect to the above compilation organization and the goals of achieving information hiding and restricted scope:

5. Assuming the partial code above was completed and contained no syntax errors, if **only** “Calvin.cpp” is **compiled** (not built) within Microsoft Visual C++, which of the following type of errors would occur:
  - 1) Compilation errors: missing Hobbes() prototype
  - 2) Compilation error: undeclared identifiers ‘Susie’
  - 3) Compilation Error: missing main function.
  - 4) No errors would be generated.
  
6. Which of the following prototypes should be moved from its unit source.cpp file to the unit header.h file?

1) void Rosalyn ( /* parameters */ );	3) void Calvin ( /* parameters */ );
2) void Hobbes( /* parameters */ );	4) void Susie ( /* parameters */ );
  
7. In addition to the include directives listed above, where else **should** “Susie.h” be included?

(1) main.h	(3) Calvin.h	(5) Susie.h
(2) main.cpp	(4) Calvin.cpp	(6) nowhere else
  
8. In addition to the include directives listed above, where else **should** “Calvin.h” be included?

(1) main.h	(3) Susie.h	(5) Calvin.h
(2) main.cpp	(4) Susie.cpp	(6) nowhere else
  
9. Assume the partial code above was completed and contained no compilation or linking errors and that the files were contained within a MSVC project. How many different object files (.obj) would the MSVC project build produce?

(1) 1	(2) 2	(3) 3	(4) 4
(5) 5	(6) 6	(7) 7	(8) 0

## II. Separate Compilation (*continued*)

For the next two questions, consider a C++ program composed of three `cpp` files and three corresponding header files, as shown below. All function calls are shown, as are all `#include` directives, type declarations and function prototypes. In the source and header files, there should be only one physical occurrence of a function prototype, and one physical occurrence of a type declaration. Do not assume that any preprocessor directives are used but not shown.

```
// main.h
//. .
class MainClass {
    //. .
};
```

```
// main.cpp
#include "main.h"
#include "ClassToo.h"
#include "Test2.h"
//. .
void main() {
    ClassToo C;
    Test2(C);
    //. .
}
```

```
// Test2.h
//. .
void Test2(ClassToo C2obj);
//. .
```

```
// Test2.cpp
#include "Test2.h"
//. .
void Test2(ClassToo C2obj) {
    //. .
}
```

```
// ClassToo.h
#include "main.h"
//. .
class ClassToo {
    private:
        MainClass Mobj;
    //. .
};
```

```
// ClassToo.cpp
#include " ClassToo.h"
//. .
// ClassToo member Functions
//. .
```

10. If the organization shown above is used, and no preprocessor directives are added, what will the compiler complain about when `main.cpp` is compiled?
- 1) Nothing.
  - 2) Multiple definitions for `MainClass`.
  - 3) Multiple definitions for `ClassToo`.
  - 4) Multiple definitions for `Test2()`.
  - 5) Both 2, 3 and 4.
  - 6) Undeclared identifier `MainClass`.
  - 7) Undeclared identifier `ClassToo`.
  - 8) Undeclared identifier `Test2`.
  - 9) None of these.
11. If the organization shown above is used, and no preprocessor directives are added, what will the compiler complain about when `Test2.cpp` is compiled?
- 1) Nothing.
  - 2) Multiple definitions for `ClassToo`.
  - 3) Multiple definitions for `Test2()`.
  - 4) Both 2 and 3.
  - 5) Undeclared identifier `ClassToo`.
  - 6) Undeclared identifier `Test2()`.
  - 7) Both 5 and 6.
  - 8) 2, 3, 5, and 6
  - 9) None of these.
12. (True or False) The order of the `#include` statements in `main.cpp` does not matter, (i.e. if `#include "Test2.h"` is listed above `#include "main.h"` the same compilation as above would result?

- 1) True
- 2) False

### III. Linked List Class Manipulation

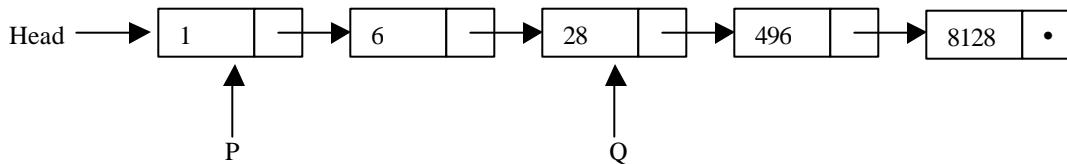

Consider the linked list class and list node declarations given below:

```
class ItemType {
private:
    int Value;
public:
    ItemType();
    ItemType(int newValue);
    void setValue(int newValue);
    int getValue() const ;
};
```

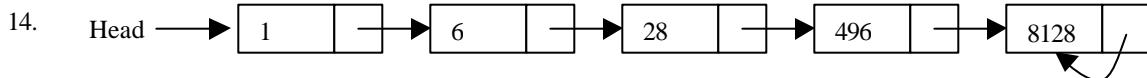

```
class LinkNode {
private:
    ItemType Data;
    LinkNode* Next;
public:
    LinkNode();
    LinkNode(ItemType newData);
    bool setNext(LinkNode* newNext);
    bool setData(ItemType newData);
    ItemType getData() const;
    LinkNode* getNext() const;
};

LinkNode *Head, *P, *Q;
```

Assume that the member functions above have been implemented correctly to carry out their intended task. Given the initial list structure below:

For the next 4 questions, select from the code segments on the following page, the segment that would transmogrify the above list into each of the lists shown below. Assume the list structure above as your starting point (for each question). Choose from the possible answers given on the following page.

### III. Linked List Class Manipulation (*continued*)

Select from the possible answers for the 4 questions given on the previous page.

<pre>1) LinkNode *R=Head; Head = R-&gt;getNext(); R-&gt;setNext(R-&gt;getNext()-&gt;getNext()); delete R; R = Q-&gt;getNext(); Q-&gt;getNext()-&gt;     setNext(R-&gt;getNext()-&gt;getNext()); delete R-&gt;getNext();</pre>	<pre>2) LinkNode *R=Head; delete R-&gt;getNext(); R = P = Q = NULL; Head-&gt;setNext(R);</pre>
<pre>3) LinkNode *T=Head; while (T-&gt;getNext()-&gt;getNext()       != NULL) {     T = T-&gt;getNext(); } //while T-&gt;getNext()-&gt;     setNext(Q-&gt;getNext()-&gt;getNext()); T = T-&gt;getNext(); Q = T-&gt;getNext();</pre>	<pre>4) LinkNode *T=NULL; while (P-&gt;getNext() != NULL) {     T = P;     P = P-&gt;getNext();     delete T; } //while delete P; P = Q = T = NULL; Head-&gt;setNext(P);</pre>
<pre>5) for (int i=0; i&lt;3; i++)     P = P-&gt;getNext(); delete P-&gt;getNext(); P-&gt;setNext(NULL); LinkNode *T=Head-&gt;getNext(); Head-&gt;setNext(     Head-&gt;getNext()-&gt;getNext() ); delete T; T = Head-&gt;getNext();</pre>	<pre>6) for (Q=P; P != NULL; P=Q) {     Q = Q-&gt;getNext();     delete P; } Head = P;</pre>
<pre>7) LinkNode *R=Head-&gt;getNext(); Head = P-&gt;getNext(); delete P; P = NULL; R = R-&gt;getNext()-&gt;getNext(); Q-&gt; setNext(R-&gt;getNext()); delete R; R = NULL; Q = Q-&gt;getNext();</pre>	<pre>8) opp( Head, Q-&gt;getNext()-&gt;getNext() ); // . . . void opp( LinkNode* x, LinkNode* y ) {     LinkNode* t;     if (x != NULL &amp;&amp; y != NULL &amp;&amp; x != y) {         for (t=x; (t!=NULL &amp;&amp;                   t-&gt;getNext()!=y); )             t = t-&gt;getNext();         int s = x-&gt;getData().getValue();         x-&gt;setData(y-&gt;getData().getValue());         y-&gt;setData(s);         opp(x-&gt;getNext(), t);     } //if } //opp</pre>

9)    delete [4] Head->getNext(); Head->setNext(NULL);	10)    None of the above

#### **IV. Class Pointers**

For the following 4 questions, assume the following declarations:

```
class Item; //forward declaration
typedef Item* ItemPtr;
class Item {
    private:
        ItemPtr link;
        char data;
    public: //member functions
        void TestFN();
};
```

```
//inside the Item member function TestFN
    Item obj;
    obj.data = 'A';
    obj.link = new Item;
    *this = obj;
    data = 'B';
    obj.link->link = &obj;
    link->data = 'C';
    link->link = NULL;
```

## V. Object Manipulations

Assume the following class declaration and implementation:

```
class Watterson {
private:
    char* comic;
public:
    Watterson (char com='*');
    char getComic() const;
    void setComic(char com);
    bool operator==(const Watterson& watt) const;
    ~Watterson();
};

Watterson::Watterson (char com) {
    comic = new char(com);
}

char Watterson::getComic() const {
    return(*comic);
}

void Watterson::setComic(char com) {
    *comic = com;
}

bool Watterson::operator==(const Watterson& watt) const {
    return ( int(*comic) == int(*(watt.comic)) );
}

Watterson::~Watterson () {
    delete comic;
}
```

Given the following code:

```
char Wormwood (Watterson Moe);

void main() {
    Watterson Calvin, Hobbes('H');
    Watterson Susie;

    Susie = Calvin;
    Susie.setComic('+');

    cout << "Contents of Calvin is:" << Calvin.getComic() << endl;      //LINE 1
    cout << "Contents of Susie is:" << Susie.getComic() << endl;      //LINE 2
    cout << "Contents of Hobbes is:" << Wormwood(Hobbes) << endl;      //LINE 3
    cout << "Contents of Hobbes is:" << Hobbes.getComic() << endl;      //LINE 4
}

char Wormwood (Watterson Moe) { return ( Moe.getComic() ); }
```

For the next 4 questions, select your answers from the following:

- |        |                    |                  |
|--------|--------------------|------------------|
| 1) '*  | 3) 'H'             | 5) None of these |
| 2) '+' | 4) Execution Error |                  |

21. What character is output by the call `Calvin.getComic()` in LINE 1 above?
22. What character is output by the call `Susie.getComic()` in LINE 2 above?

23. What character is output by the call `Wormwood(Hobbes)` in LINE 3 above?
24. What character is output by the call `Hobbes.getComic()` in LINE 4 above?
25. (True/False) The above code contains a memory leak.  
  - 1) True
  - 2) False

*Have a great Thanksgiving break, ☺*
