Chapter 3

OS Organization

Design of OS

- Factors influencing *design* of OS
 - 1. Performance
 - 2. Protection/Security
 - 3. Correctness
 - 4. Maintainability
 - 5. Commercial factors
 - 6. Standard & Open Systems

CS 3204 - Arthur

(1) Performance

- Functionality v/s Performance
 - More resource abstraction
 - Higher levels of resource abstraction
- Coding OS w.r.t. Performance
 - Assembly => Fast execution
 - BUT Assembly => Debugging ???
- Others?

CS 3204 - Arthur

3

(2) Protection & Security

- OS MUST NOT allow one process to interfere with the operations of another process
 - File access
 - Memory space
 - Resources
- Therefore, need to implement strategies that support Isolation & Sharing
- Challenge is:
 - If OS implements a policy, how to prevent <u>application</u> from changing it

CS 3204 - Arthur

(3) Maintainability & (4) Correctness

- Maintainability
 - Design and write systems to be maintainable
 - => Sacrifice performance
- Correctness
 - Does the OS meet the requirements ?
 - Can we write valid set of requirements?

CS 3204 - Arthur

5

(5) Commercial influence

- Commercial Influence
 - DOS => IBM-PC
 - UNIX => open platform
 - Commercial influence
 - => machine nuances that hinder portability
 - UNIX => portable
 - MAC ???
 - Windows ???

CS 3204 - Arthur

(6) Standards & Open Systems

- Early systems: User tied to ONE vendor
- Desire: User gets pieces from ANY set of vendors
 Need for Standards and Open Systems
- Open Systems
 - => Network of heterogeneous systems =>Information flow [Big Endian v/s Little Endian]

CS 3204 - Arthur

7

(6) Standards & Open Systems

- Open systems achieved through
 - Application integration => common interface
 - Portability => more applications among hardware platforms
 - Interoperability
 - Standardize remote access facilities
 - => All systems talk same language over the network
- POSIX = Open system
 - Standardize OS interfaces

CS 3204 - Arthur

R

Basic Functions of OS

- 1. Device Management
- 2. Process / Resource Management
- 3. Memory Management
- 4. File Management

CS 3204 - Arthur

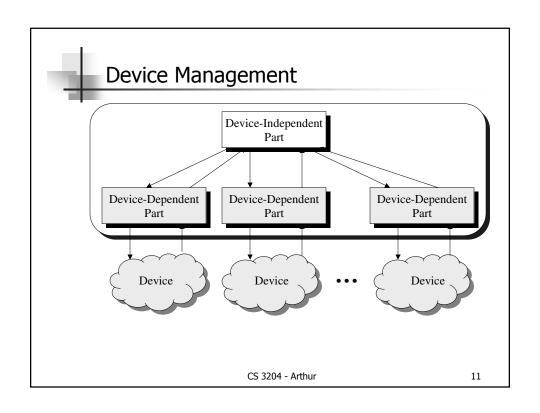

9

Device Management

- Isolation
- Allocation
- Share
- Need device drivers
 - Must be able to configure into OS without recompiling OS (no Source Code)

CS 3204 - Arthur

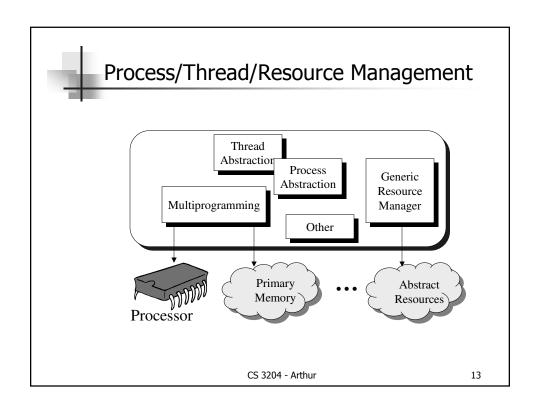

Process/Thread/Resource Management

- Process
 - Creating
 - Destroying
 - Blocking
 - Running
- Resource
 - Isolation
 - Sharing

CS 3204 - Arthur

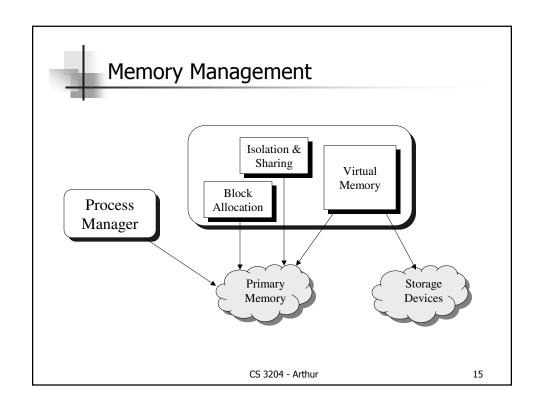

Memory Management

- Allocation & use of main memory
 - Isolation & Protection
 - Sharing
- Virtual Memory
 - Main memory & storage devices
 - Reference 'memory' on storage devices
- Segmented VM viable approach
 - Block & Offset

CS 3204 - Arthur

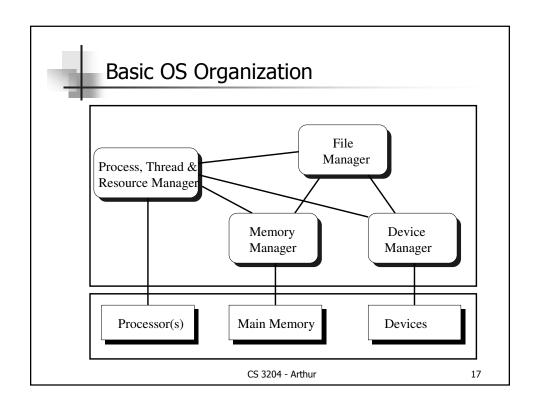

File Management

- Transfer from main memory to file
 - Code (VM)
 - Data (VM)
 - Editors
- Different file management strategies
 - Sequential
 - Indexed
 - Direct access
 - Networked

CS 3204 - Arthur

Implementation Considerations

- Process Modes
- Kernels
- Method of requesting system services

CS 3204 - Arthur

Processor Modes

- Supervisor mode
 - Can execute any instruction
 - Can reference all memory locations
- User mode
 - Subset of instructions
 - Can only reference a subset of memory locations

In UNIX:

What can root execute that application cannot?

- renice : OS callchown : OS call
- IOCTL (OS call) if user interleaves output on printer
- Memory accesses

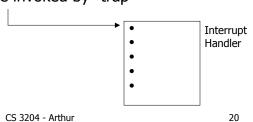

CS 3204 - Arthur

19

Kernel

- Trusted part of the OS
- Executes in Supervisor mode
- Generally, memory resident
- OS <u>extension</u> run in User mode
 - Example: Drivers
- Kernel functions are invoked by "trap"

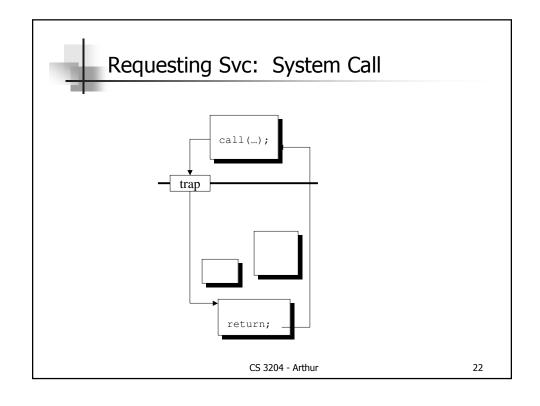

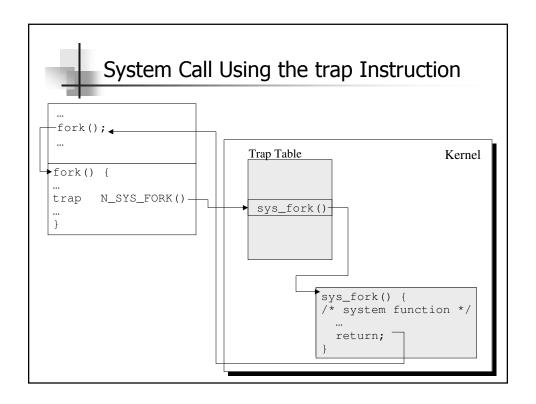

Requesting Service from OS

- System call
 - Process traps to OS Interrupt Handler
 - Supervisor mode set
 - Desired function executed
 - User mode set
 - Returns to application

CS 3204 - Arthur

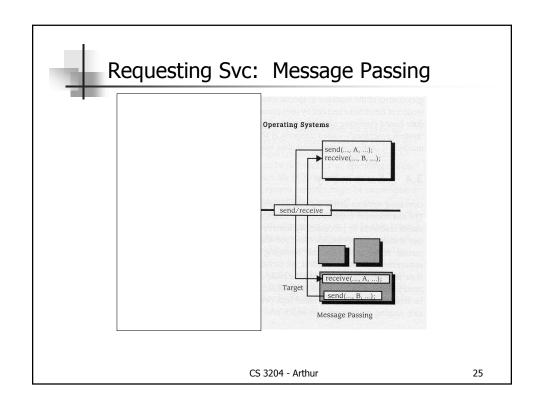

Message Passing

- User process constructs message indicating function (service) needed
- Invokes send to pass message to OS
- Process blocks
- OS receives message
- OS initiates Function execution
- Upon Function completion, OS Returns ("OK")
- Process un-blocks

Send and *Receive* analyze message for proper format, etc.

CS 3204 - Arthur

Message Passing...

System call are more efficient

BUT

they also unduly tie the Application to specifics of the OS

■ Tradeoffs ???

CS 3204 - Arthur
