

Pintos: Threads Project

Slides by: Vijay Kumar

Updated by Godmar Back

Presented by: Min Li

Introduction to Pintos

- Simple OS for the 80x86 architecture
- Capable of running on real hardware
- We use bochs, qemu to run Pintos
- Provided implementation supports kernel threads, user programs and file system
- In the projects, strengthen support for these
+ implement support for virtual memory

Development Environment

- Log on to the Linux cluster remotely using SSH
 - ssh -Y yourlogin@rlogin.cs.vt.edu (for trusted X11 forwarding)
- Need ssh client
- X11 server preferable, but not absolutely needed
- Use CVS
 - for managing and merging code written by the team members
 - keeping track of multiple versions of files

CVS Setup

- Start by choosing a code keeper for your group
- Keeper creates repository on 'ap2'
- Summary of commands to setup CVS

```
ssh ap2
```

```
cd /shared/cs3204
```

```
mkdir Proj-keeper_pid
```

```
setfacl --set u::rwx,g::---,o::--- Proj-keeper_pid
```

```
# for all other group members do:
```

```
setfacl -m u:member-pid:rwx Proj-keeper_pid
```

```
setfacl -d --set u::rwx,g::---,o::--- Proj-keeper_pid
```

```
# for all group members, including the keeper, do:
```

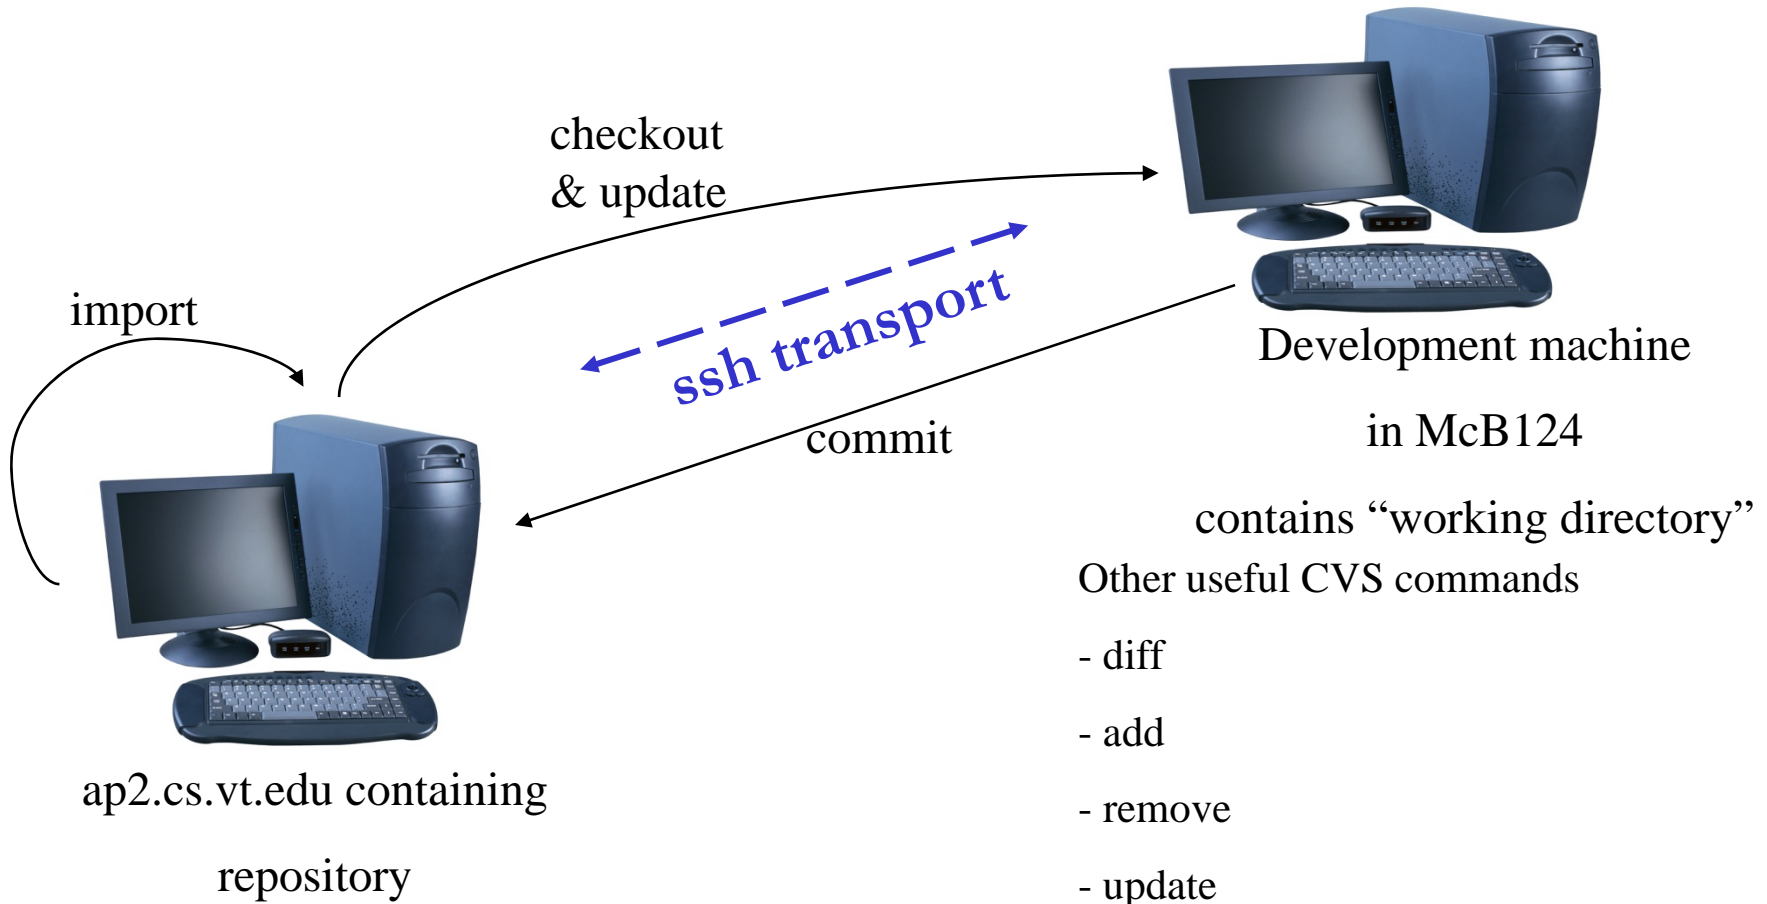

```
setfacl -d -m u:member_pid:rwx Proj-keeper_pid
```

```
cvs -d /shared/cs3204/Proj-keeper_pid init
```

```
cd /home/courses/cs3204/pintos/pintos
```

```
cvs -d /shared/cs3204/Proj-keeper_pid import -m "Imported sources" pintos foobar start
```

Using CVS

CVS Jargon

- “Do an update”
 - “Pull the latest”
- } Bring your working directory in sync with the CVS repository to pick up and integrate changes other team members may have made.
- “Commit your stuff”
 - “Push your changes”
- } Upload your change to the CVS repository, allowing others to see them. May create a new revision if there were changes.
- “Diff against the HEAD”
- } Compare your working version to the version last checked in by any team member.
- “Diff against BASE”
 - “outstanding diffs?”
- } Compare your working version to the version you last checked out. Any changes you’ve made are “outstanding” – group members can’t see them yet.

cv^s -nq update -d

- `cvs update` – download latest changes from repository and merge into working copy
- ‘-n’ show me what’d do, don’t do it
- ‘-d’ pick up additional subdirectories (not done by default)
- Outputs:
 - (nothing) – means you are up-to-date
 - P or U – means there’s a newer version
 - M – means you have outstanding diffs
 - C – means there’s a newer version and you have outstanding diffs and they can’t be reconciled
 - ? – this file is not part of the repository

Getting started with Pintos

- Set env variable `CVS_RSH` to `/usr/bin/ssh`
`export CVS_RSH=/usr/bin/ssh`
If you don't, it will assume "rsh" which is not a supported service. Connection failures or timeouts will result.
- Check out a copy of the repository to directory 'dir'
`cvs -d :ext:your_pid@ap2.cs.vt.edu:/shared/cs3204/Proj-keeper_pid checkout -d dir pintos`
- Add `~cs3204/bin` to path add to `.bash_profile`
`export PATH=~cs3204/bin:$PATH`
- Build pintos
`cd dir/src/threads`
`make`
`cd build`
`pintos run alarm-multiple`

Project 1 Overview

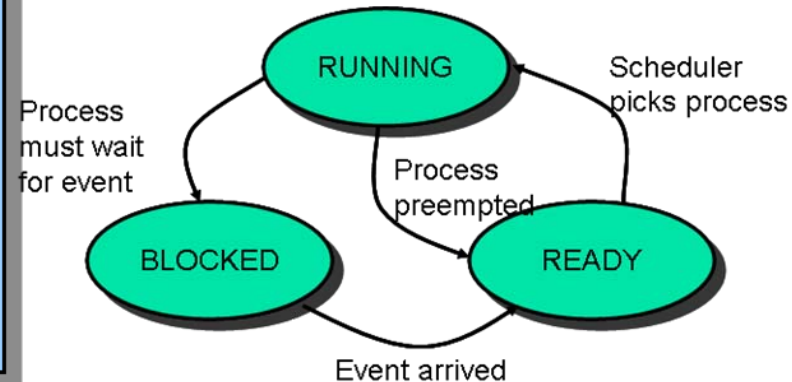

- Extend the functionality of a minimally functional thread system
- Implement
 - Alarm Clock
 - Priority Scheduling
 - Including priority inheritance
 - Advanced Scheduler

Pintos Thread System

```
struct thread
{
    tid_t tid;          /* Thread identifier. */
    enum thread_status status; /* Thread state. */
    char name[16]; /* Name (for debugging purposes). */
    uint8_t *stack; /* Saved stack pointer. */
    int priority; /* Priority. */
    struct list_elem allelem; /* List element for all-threads list. */
    /* Shared between thread.c and synch.c. */
    struct list_elem elem; /* List element. */
};
```

You add more fields here as you need them.

```
#ifdef USERPROG
    /* Owned by userprog/process.c. */
    uint32_t *pagedir; /* Page directory. */
#endif
    /* Owned by thread.c. */
    unsigned magic; /* Detects stack overflow. */
};
```

Pintos Thread System (contd...)

- Read `threads/thread.c` and `threads/synch.c` to understand
 - How the switching between threads occur
 - How the provided scheduler works
 - How the various synchronizations primitives work

Alarm Clock

- Reimplement `timer_sleep()` in `devices/timer.c` without busy waiting

```
/* Suspends execution for approximately TICKS timer ticks. */
```

```
void timer_sleep (int64_t ticks){  
    int64_t start = timer_ticks ();  
    ASSERT (intr_get_level () == INTR_ON);  
    while (timer_elapsed (start) < ticks)  
        thread_yield ();  
}
```

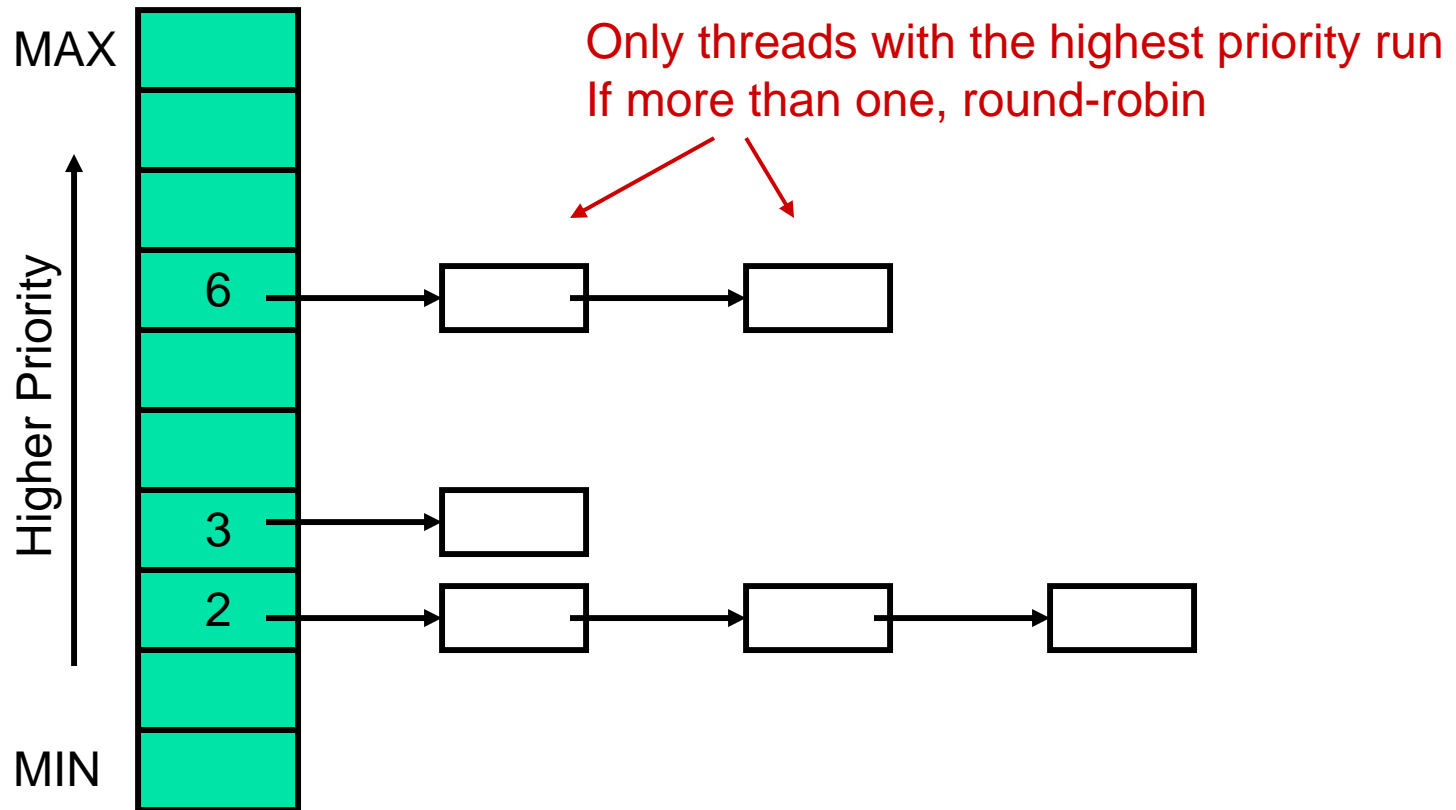

- Implementation details
 - Remove thread from ready list and put it back after sufficient ticks have elapsed

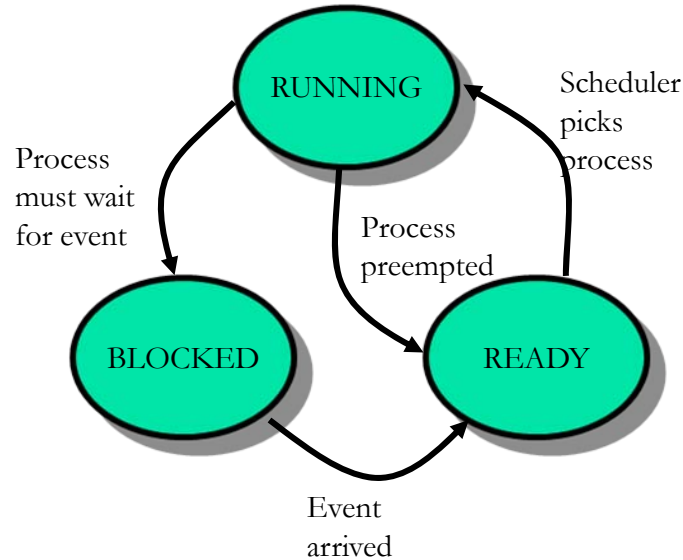

Priority Scheduler

- Ready thread with highest priority gets the processor
- When a thread is added to the ready list that has a higher priority than the currently running thread, immediately yield the processor to the new thread
- When threads are waiting for a lock, semaphore or a condition variable, the highest priority waiting thread should be woken up first
- Implementation details
 - compare priority of the thread being added to the ready list with that of the running thread
 - select next thread to run based on priorities
 - compare priorities of waiting threads when releasing locks, semaphores, condition variables

Priority Based Scheduling

Using `thread_yield()` to implement preemption

- Current thread (“RUNNING”) is moved to READY state, added to READY list.
- Then scheduler is invoked. Picks a new READY thread from READY list.
- Case a): there’s only 1 READY thread. Thread is rescheduled right away
- Case b): there are other READY thread(s)
 - b.1) another thread has higher priority – it is scheduled
 - b.2) another thread has same priority – it is scheduled provided the previously running thread was inserted in tail of ready list.
- “`thread_yield()`” is a call you can use whenever you identify a need to preempt current thread.
- **Exception:** inside an interrupt handler, use “`intr_yield_on_return()`” instead

Priority Inversion

- Strict priority scheduling can lead to a phenomenon called “priority inversion”
- Supplemental reading:
 - What really happened on the Mars Pathfinder? [[comp.risks](#)]
- Consider the following example where $\text{prio}(H) > \text{prio}(M) > \text{prio}(L)$
 - H needs a lock currently held by L, so H blocks
 - M that was already on the ready list gets the processor before L
 - H indirectly waits for M
 - (on Path Finder, a watchdog timer noticed that H failed to run for some time, and continuously reset the system)

Priority Donation

- When a high priority thread H waits on a lock held by a lower priority thread L, donate H's priority to L and recall the donation once L releases the lock
- Implement priority donation for locks
- Handle the cases of multiple donations and nested donations

Multiple Priority Donations: Example

Low Priority thread

```
lock_acquire (&a);  
lock_acquire (&b);  
  
thread_create ("a", PRI_DEFAULT + 1, a_thread_func, &a);  
msg ("Main thread should have priority %d. Actual priority:  
%d.", PRI_DEFAULT + 1, thread_get_priority ());  
  
thread_create ("b", PRI_DEFAULT + 2, b_thread_func, &b);  
msg ("Main thread should have priority %d. Actual priority:  
%d.", PRI_DEFAULT + 2, thread_get_priority ());
```

Medium Priority thread

```
static void a_thread_func (void *lock_)  
{  
    struct lock *lock = lock_;  
    lock_acquire (lock);  
    msg ("Thread a acquired lock a.");  
    lock_release (lock);  
    msg ("Thread a finished.");  
}
```

High Priority thread

```
static void b_thread_func (void *lock_)  
{  
    struct lock *lock = lock_;  
    lock_acquire (lock);  
    msg ("Thread b acquired lock b.");  
    lock_release (lock);  
    msg ("Thread b finished.");  
}
```

Nested Priority Donations: Example

Low Priority thread

```
lock_acquire (&a);
locks.a = &a;
locks.b = &b;

thread_create ("medium", PRI_DEFAULT + 1, m_thread_func, &locks);
msg ("Low thread should have priority %d. Actual priority: %d.",
PRI_DEFAULT + 1, thread_get_priority ());

thread_create ("high", PRI_DEFAULT + 2, h_thread_func, &b);
msg ("Low thread should have priority %d. Actual priority: %d.",
PRI_DEFAULT + 2, thread_get_priority ());
```

Medium Priority thread

```
static void m_thread_func (void *locks_)
{
    struct locks *locks = locks_;
    lock_acquire (locks->b);
    lock_acquire (locks->a);

    msg ("Medium thread should have priority %d.
Actual priority: %d.", PRI_DEFAULT + 2,
thread_get_priority ());
...}
```

High Priority thread

```
static void h_thread_func (void *lock_)
{
    struct lock *lock = lock_;

    lock_acquire (lock);
    ...}
```

Advanced Scheduler

- Implement Multi Level Feedback Queue Scheduler
- Priority donation not needed in the advanced scheduler – two implementations are not required to coexist
 - Only one is active at a time
- Advanced Scheduler must be chosen only if ‘-mlfqs’ kernel option is specified
- Read section on 4.4 BSD Scheduler in the Pintos manual for detailed information
- Some of the parameters are real numbers and calculations involving them have to be simulated using integers.
 - Write a fixed-point layer (header file)

Typesafe Fixed-Point Layer

```
typedef struct
{
    double re;
    double im;
} complex_t;
```

```
static inline complex_t
complex_add(complex_t x, complex_t y)
{
    return (complex_t){ x.re + y.re, x.im + y.im };
}
```

```
static inline double
complex_real(complex_t x)
{
    return x.re;
}
```

```
static inline double
complex_imaginary(complex_t x)
{
    return x.im;
}
```

```
static inline double
complex_abs(complex_t x)
{
    return sqrt(x.re * x.re + x.im * x.im);
}
```

Suggested Order

- Alarm Clock
 - easier to implement compared to the other parts
 - other parts not dependent on this
- Priority Scheduler
 - needed for implementing Priority Donation and Advanced Scheduler
- Priority Donation | Advanced Scheduler
 - these two parts are independent of each other
 - can be implemented in any order but only after Priority Scheduler is ready

Debugging your code

- printf, ASSERT, backtraces, gdb
- Running pintos under gdb
 - Invoke pintos with the gdb option
`pintos --gdb -- run testname`
 - On another terminal invoke gdb
`pintos-gdb kernel.o`
 - Issue the command
`debugpintos`
 - All the usual gdb commands can be used: step, next, print, continue, break, clear etc
 - Use the pintos debugging macros described in manual

Tips

- Read the relevant parts of the Pintos manual
- Read the comments in the source files to understand what a function does and what its prerequisites are
- Be careful with synchronization primitives
 - disable interrupts only when absolutely needed
 - use locks, semaphores and condition variables instead
- Beware of the consequences of the changes you introduce
 - might affect the code that gets executed before the boot time messages are displayed, causing the system to reboot or not boot at all

Tips (contd...)

- Include *ASSERT*s to make sure that your code works the way you want it to
- Integrate your team's code often to avoid surprises
- Use *gdb* to debug
- Make changes to the test files, if needed
- Test using *qemu* simulator and the `-j` option with *bochs* (introduces variability whereas default options run in reproducibility mode)

Grading & Deadline

- Tests – 50%
 - All group members get the same grade
- Design – 50%
 - data structures, algorithms, synchronization, rationale and coding standards
 - Each group member will submit those individually: you can discuss them in the group, and ask each other questions – but must create write-up individually. Instructions will be posted on the website.
- Due Sep 28, 2009 by 11:59pm

Good Luck!
