

Chapter 14: Protection

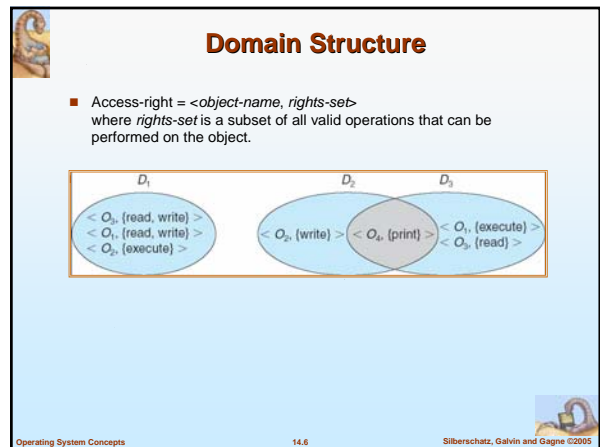

Chapter 14: Protection

- Goals of Protection
- Principles of Protection
- Domain of Protection
- Access Matrix
- Implementation of Access Matrix
- Access Control
- Revocation of Access Rights
- Capability-Based Systems
- Language-Based Protection

- ## Objectives
- Discuss the goals and principles of protection in a modern computer system
 - Explain how protection domains combined with an access matrix are used to specify the resources a process may access
 - Examine capability and language-based protection systems

- ## Goals of Protection
- Operating system consists of a collection of objects, hardware or software
 - Each object has a unique name and can be accessed through a well-defined set of operations.
 - Protection problem - ensure that each object is accessed correctly and only by those processes that are allowed to do so.

- ## Principles of Protection
- Guiding principle – principle of least privilege
 - Programs, users and systems should be given just enough privileges to perform their tasks

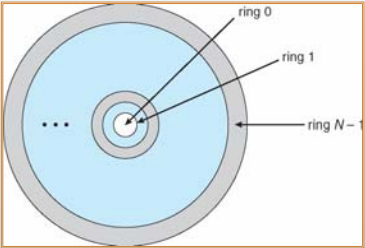

Domain Implementation (UNIX)

- System consists of 2 domains:
 - User
 - Supervisor
- UNIX
 - Domain = user-id
 - Domain switch accomplished via file system.
 - ▶ Each file has associated with it a domain bit (setuid bit).
 - ▶ When file is executed and setuid = on, then user-id is set to owner of the file being executed. When execution completes user-id is reset.

Operating System Concepts 14.7 Silberschatz, Galvin and Gagne ©2005

Domain Implementation (Multics)

- Let D_i and D_j be any two domain rings.
- If $j < i \Rightarrow D_i \subseteq D_j$

Multics Rings

Operating System Concepts 14.8 Silberschatz, Galvin and Gagne ©2005

Access Matrix

- View protection as a matrix (*access matrix*)
- Rows represent domains
- Columns represent objects
- $Access(i, j)$ is the set of operations that a process executing in Domain _{i} can invoke on Object _{j}

Operating System Concepts 14.9 Silberschatz, Galvin and Gagne ©2005

Access Matrix

object domain	F_1	F_2	F_3	printer
D_1	read		read	
D_2				print
D_3		read	execute	
D_4	read write		read write	

Figure A

Operating System Concepts 14.10 Silberschatz, Galvin and Gagne ©2005

Use of Access Matrix

- If a process in Domain D_i tries to do "op" on object O_j , then "op" must be in the access matrix.
- Can be expanded to dynamic protection.
 - Operations to add, delete access rights.
 - Special access rights:
 - ▶ owner of O_i
 - ▶ copy op from O_i to O_j
 - ▶ control – D_i can modify D_j access rights
 - ▶ transfer – switch from domain D_i to D_j

Operating System Concepts 14.11 Silberschatz, Galvin and Gagne ©2005

Use of Access Matrix (Cont.)

- Access matrix design separates mechanism from policy.
 - Mechanism
 - ▶ Operating system provides access-matrix + rules.
 - ▶ If ensures that the matrix is only manipulated by authorized agents and that rules are strictly enforced.
 - Policy
 - ▶ User dictates policy.
 - ▶ Who can access what object and in what mode.

Operating System Concepts 14.12 Silberschatz, Galvin and Gagne ©2005

Implementation of Access Matrix

- Each column = Access-control list for one object
Defines who can perform what operation.
 - Domain 1 = Read, Write
 - Domain 2 = Read
 - Domain 3 = Read
 - ⋮
- Each Row = Capability List (like a key)
For each domain, what operations allowed on what objects.
 - Object 1 – Read
 - Object 4 – Read, Write, Execute
 - Object 5 – Read, Write, Delete, Copy

Access Matrix of Figure A With Domains as Objects

object domain	F ₁	F ₂	F ₃	laser printer	D ₁	D ₂	D ₃	D ₄
D ₁	read		read			switch		
D ₂				print			switch	switch
D ₃		read	execute					
D ₄	read write		read write		switch			

Figure B

Operating System Concepts 14.14 Silberschatz, Galvin and Gagne ©2005

Access Matrix with Copy Rights

object domain	F ₁	F ₂	F ₃
D ₁	execute		write*
D ₂	execute	read*	execute
D ₃	execute		

(a)

object domain	F ₁	F ₂	F ₃
D ₁	execute		write*
D ₂	execute	read*	execute
D ₃	execute	read	

(b)

Operating System Concepts 14.15 Silberschatz, Galvin and Gagne ©2005

Access Matrix With Owner Rights

object domain	F ₁	F ₂	F ₃
D ₁	owner execute		write
D ₂		read* owner	read* owner write
D ₃	execute		

(a)

object domain	F ₁	F ₂	F ₃
D ₁	owner execute		write
D ₂		owner read* write*	read* owner write
D ₃		write	write

(b)

Modified Access Matrix of Figure B

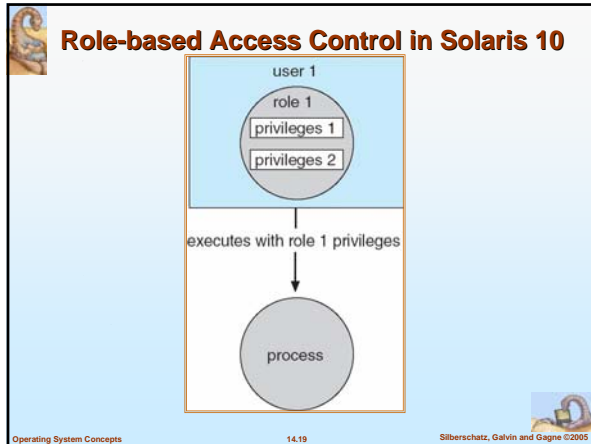

object domain	F ₁	F ₂	F ₃	laser printer	D ₁	D ₂	D ₃	D ₄
D ₁	read		read			switch		
D ₂				print			switch	switch control
D ₃		read	execute					
D ₄	write		write		switch			

Operating System Concepts 14.17 Silberschatz, Galvin and Gagne ©2005

Access Control

- Protection can be applied to non-file resources
- Solaris 10 provides **role-based access control** to implement least privilege
 - Privilege is right to execute system call or use an option within a system call
 - Can be assigned to processes
 - Users assigned roles granting access to privileges and programs

Operating System Concepts 14.18 Silberschatz, Galvin and Gagne ©2005

- ### Revocation of Access Rights
- **Access List** – Delete access rights from access list.
 - Simple
 - Immediate
 - **Capability List** – Scheme required to locate capability in the system before capability can be revoked.
 - Reacquisition
 - Back-pointers
 - Indirection
 - Keys
- Operating System Concepts 14.20 Silberschatz, Galvin and Gagne ©2005

- ### Capability-Based Systems
- Hydra
 - Fixed set of access rights known to and interpreted by the system.
 - Interpretation of user-defined rights performed solely by user's program; system provides access protection for use of these rights.
 - Cambridge CAP System
 - Data capability - provides standard read, write, execute of individual storage segments associated with object.
 - Software capability - interpretation left to the subsystem, through its protected procedures.
- Operating System Concepts 14.21 Silberschatz, Galvin and Gagne ©2005

- ### Language-Based Protection
- Specification of protection in a programming language allows the high-level description of policies for the allocation and use of resources.
 - Language implementation can provide software for protection enforcement when automatic hardware-supported checking is unavailable.
 - Interpret protection specifications to generate calls on whatever protection system is provided by the hardware and the operating system.
- Operating System Concepts 14.22 Silberschatz, Galvin and Gagne ©2005

- ### Protection in Java 2
- Protection is handled by the Java Virtual Machine (JVM)
 - A class is assigned a protection domain when it is loaded by the JVM.
 - The protection domain indicates what operations the class can (and cannot) perform.
 - If a library method is invoked that performs a privileged operation, the stack is inspected to ensure the operation can be performed by the library.
- Operating System Concepts 14.23 Silberschatz, Galvin and Gagne ©2005

Stack Inspection

protection domain:	untrusted applet	URL loader	networking
socket permission:	none	*.lucent.com:80, connect	any
class:	gui: ... get(url); open(addr); ...	get(URL u): ... doPrivileged { open("proxy.lucent.com:80"); } <request u from proxy:> ...	open(Addr a): ... checkPermission(a, connect); connect(a); ...
