

# Dynamic Programming

T. M. Murali

October 14, 19, 21, 26, 28, 2009

# Algorithm Design Techniques

1. Goal: design efficient (polynomial-time) algorithms.

# Algorithm Design Techniques

1. Goal: design efficient (polynomial-time) algorithms.
2. Greedy
  - ▶ Pro: natural approach to algorithm design.
  - ▶ Con: many greedy approaches to a problem. Only some may work.
  - ▶ Con: many problems for which *no* greedy approach is known.

# Algorithm Design Techniques

1. Goal: design efficient (polynomial-time) algorithms.
2. Greedy
  - ▶ Pro: natural approach to algorithm design.
  - ▶ Con: many greedy approaches to a problem. Only some may work.
  - ▶ Con: many problems for which *no* greedy approach is known.
3. Divide and conquer
  - ▶ Pro: simple to develop algorithm skeleton.
  - ▶ Con: conquer step can be very hard to implement efficiently.
  - ▶ Con: usually reduces time for a problem known to be solvable in polynomial time.

# Algorithm Design Techniques

1. Goal: design efficient (polynomial-time) algorithms.
2. Greedy
  - ▶ Pro: natural approach to algorithm design.
  - ▶ Con: many greedy approaches to a problem. Only some may work.
  - ▶ Con: many problems for which *no* greedy approach is known.
3. Divide and conquer
  - ▶ Pro: simple to develop algorithm skeleton.
  - ▶ Con: conquer step can be very hard to implement efficiently.
  - ▶ Con: usually reduces time for a problem known to be solvable in polynomial time.
4. **Dynamic programming**
  - ▶ More powerful than greedy and divide-and-conquer strategies.
  - ▶ *Implicitly* explore space of all possible solutions.
  - ▶ Solve multiple sub-problems and build up correct solutions to larger and larger sub-problems.
  - ▶ Careful analysis needed to ensure number of sub-problems solved is polynomial in the size of the input.

# History of Dynamic Programming

- ▶ Bellman pioneered the systematic study of dynamic programming in the 1950s.

# History of Dynamic Programming

- ▶ Bellman pioneered the systematic study of dynamic programming in the 1950s.
- ▶ The Secretary of Defense at that time was hostile to mathematical research.
- ▶ Bellman sought an impressive name to avoid confrontation.
  - ▶ “it’s impossible to use dynamic in a pejorative sense”
  - ▶ “something not even a Congressman could object to” (Bellman, R. E., *Eye of the Hurricane, An Autobiography*).

# Applications of Dynamic Programming

- ▶ Computational biology: Smith-Waterman algorithm for sequence alignment.
- ▶ Operations research: Bellman-Ford algorithm for shortest path routing in networks.
- ▶ Control theory: Viterbi algorithm for hidden Markov models (CS 6604, MCB 110, 3:30-4:45pm on Oct 15).
- ▶ Computer science (theory, graphics, AI, ...): Unix `diff` command for comparing two files.

# Review: Interval Scheduling

## INTERVAL SCHEDULING

**INSTANCE:** Nonempty set  $\{(s_i, f_i), 1 \leq i \leq n\}$  of start and finish times of  $n$  jobs.

**SOLUTION:** The largest subset of mutually compatible jobs.

- ▶ Two jobs are *compatible* if they do not overlap.

# Review: Interval Scheduling

## INTERVAL SCHEDULING

**INSTANCE:** Nonempty set  $\{(s_i, f_i), 1 \leq i \leq n\}$  of start and finish times of  $n$  jobs.

**SOLUTION:** The largest subset of mutually compatible jobs.

- ▶ Two jobs are *compatible* if they do not overlap.
- ▶ Greedy algorithm: sort jobs in increasing order of finish times. Add next job to current subset only if it is compatible with previously-selected jobs.

# Weighted Interval Scheduling

## WEIGHTED INTERVAL SCHEDULING

**INSTANCE:** Nonempty set  $\{(s_i, f_i), 1 \leq i \leq n\}$  of start and finish times of  $n$  jobs and a weight  $v_i \geq 0$  associated with each job.

**SOLUTION:** A set  $S$  of mutually compatible jobs such that  $\sum_{i \in S} v_i$  is maximised.

**Figure 6.1** A simple instance of weighted interval scheduling.

# Weighted Interval Scheduling

## WEIGHTED INTERVAL SCHEDULING

**INSTANCE:** Nonempty set  $\{(s_i, f_i), 1 \leq i \leq n\}$  of start and finish times of  $n$  jobs and a weight  $v_i \geq 0$  associated with each job.

**SOLUTION:** A set  $S$  of mutually compatible jobs such that  $\sum_{i \in S} v_i$  is maximised.

**Figure 6.1** A simple instance of weighted interval scheduling.

- ▶ Greedy algorithm can produce arbitrarily bad results for this problem.

# Approach

- ▶ Sort jobs in increasing order of finish time and relabel:  $f_1 \leq f_2 \leq \dots \leq f_n$ .
- ▶ Request  $i$  comes before request  $j$  if  $i < j$ .
- ▶  $p(j)$  is the largest index  $i < j$  such that job  $i$  is compatible with job  $j$ .  
 $p(j) = 0$  if there is no such job  $i$ .
  - ▶ Jobs at indices  $\{p(j) + 1, p(j) + 2, \dots, j - 1\}$  are incompatible with job  $j$ .

**Figure 6.2** An instance of weighted interval scheduling with the functions  $p(j)$  defined for each interval  $j$ .

- ▶ We will develop optimal algorithm from obvious statements about the problem.

# Detour: a Binomial Identity

## Detour: a Binomial Identity

► Pascal's triangle:

- Each element is a binomial co-efficient.
- Each element is the sum of the two elements above it.

## Detour: a Binomial Identity

► Pascal's triangle:

- Each element is a binomial co-efficient.
- Each element is the sum of the two elements above it.

$$\binom{n}{r} = \binom{n-1}{r-1} + \binom{n-1}{r}$$

## Detour: a Binomial Identity

► Pascal's triangle:

- Each element is a binomial co-efficient.
- Each element is the sum of the two elements above it.

$$\binom{n}{r} = \binom{n-1}{r-1} + \binom{n-1}{r}$$

► Proof: Consider any subset  $S$  of  $r$  elements.

**Case 1**  $S$  contains the  $n$ th element:  
 $\binom{n-1}{r-1}$  such subsets.

**Case 2**  $S$  does not contain the  $n$ th element:  
 $\binom{n-1}{r}$  such subsets.

## Sub-problems

- ▶ Let  $\mathcal{O}$  be the optimal solution. Let us reason about  $\mathcal{O}$ .

Case 1 job  $n$  is not in  $\mathcal{O}$ .

Case 2 job  $n$  is in  $\mathcal{O}$ .

## Sub-problems

- ▶ Let  $\mathcal{O}$  be the optimal solution. Let us reason about  $\mathcal{O}$ .
  - Case 1 job  $n$  is not in  $\mathcal{O}$ .  $\mathcal{O}$  must be the optimal solution for jobs  $\{1, 2, \dots, n-1\}$ .
  - Case 2 job  $n$  is in  $\mathcal{O}$ .

## Sub-problems

- ▶ Let  $\mathcal{O}$  be the optimal solution. Let us reason about  $\mathcal{O}$ .
  - Case 1 job  $n$  is not in  $\mathcal{O}$ .  $\mathcal{O}$  must be the optimal solution for jobs  $\{1, 2, \dots, n-1\}$ .
  - Case 2 job  $n$  is in  $\mathcal{O}$ .
    - ▶  $\mathcal{O}$  cannot use incompatible jobs  $\{p(n)+1, p(n)+2, \dots, n-1\}$ .
    - ▶ Remaining jobs in  $\mathcal{O}$  must be the optimal solution for jobs  $\{1, 2, \dots, p(n)\}$ .

## Sub-problems

- ▶ Let  $\mathcal{O}$  be the optimal solution. Let us reason about  $\mathcal{O}$ .
  - Case 1 job  $n$  is not in  $\mathcal{O}$ .  $\mathcal{O}$  must be the optimal solution for jobs  $\{1, 2, \dots, n-1\}$ .
  - Case 2 job  $n$  is in  $\mathcal{O}$ .
    - ▶  $\mathcal{O}$  cannot use incompatible jobs  $\{p(n)+1, p(n)+2, \dots, n-1\}$ .
    - ▶ Remaining jobs in  $\mathcal{O}$  must be the optimal solution for jobs  $\{1, 2, \dots, p(n)\}$ .
- ▶  $\mathcal{O}$  must be the best of these two choices!

## Sub-problems

- ▶ Let  $\mathcal{O}$  be the optimal solution. Let us reason about  $\mathcal{O}$ .
  - Case 1 job  $n$  is not in  $\mathcal{O}$ .  $\mathcal{O}$  must be the optimal solution for jobs  $\{1, 2, \dots, n-1\}$ .
  - Case 2 job  $n$  is in  $\mathcal{O}$ .
    - ▶  $\mathcal{O}$  cannot use incompatible jobs  $\{p(n)+1, p(n)+2, \dots, n-1\}$ .
    - ▶ Remaining jobs in  $\mathcal{O}$  must be the optimal solution for jobs  $\{1, 2, \dots, p(n)\}$ .
- ▶  $\mathcal{O}$  must be the best of these two choices!
- ▶ Suggests finding optimal solution for sub-problems consisting of jobs  $\{1, 2, \dots, j-1, j\}$ , for all values of  $j$ .

# Recursion

- ▶ Let  $\mathcal{O}_j$  be the optimal solution for jobs  $\{1, 2, \dots, j\}$  and  $OPT(j)$  be the value of this solution ( $OPT(0) = 0$ ).

# Recursion

- ▶ Let  $\mathcal{O}_j$  be the optimal solution for jobs  $\{1, 2, \dots, j\}$  and  $OPT(j)$  be the value of this solution ( $OPT(0) = 0$ ).
- ▶ We are seeking  $\mathcal{O}_n$  with a value of  $OPT(n)$ .

# Recursion

- ▶ Let  $\mathcal{O}_j$  be the optimal solution for jobs  $\{1, 2, \dots, j\}$  and  $OPT(j)$  be the value of this solution ( $OPT(0) = 0$ ).
- ▶ We are seeking  $\mathcal{O}_n$  with a value of  $OPT(n)$ .
- ▶ To compute  $OPT(j)$ :
  - Case 1  $j \notin \mathcal{O}_j$ :

# Recursion

- ▶ Let  $\mathcal{O}_j$  be the optimal solution for jobs  $\{1, 2, \dots, j\}$  and  $OPT(j)$  be the value of this solution ( $OPT(0) = 0$ ).
- ▶ We are seeking  $\mathcal{O}_n$  with a value of  $OPT(n)$ .
- ▶ To compute  $OPT(j)$ :
  - Case 1  $j \notin \mathcal{O}_j$ :  $OPT(j) = OPT(j - 1)$ .

# Recursion

- ▶ Let  $\mathcal{O}_j$  be the optimal solution for jobs  $\{1, 2, \dots, j\}$  and  $OPT(j)$  be the value of this solution ( $OPT(0) = 0$ ).
- ▶ We are seeking  $\mathcal{O}_n$  with a value of  $OPT(n)$ .
- ▶ To compute  $OPT(j)$ :
  - Case 1  $j \notin \mathcal{O}_j$ :  $OPT(j) = OPT(j - 1)$ .
  - Case 2  $j \in \mathcal{O}_j$ :

# Recursion

- ▶ Let  $\mathcal{O}_j$  be the optimal solution for jobs  $\{1, 2, \dots, j\}$  and  $OPT(j)$  be the value of this solution ( $OPT(0) = 0$ ).
- ▶ We are seeking  $\mathcal{O}_n$  with a value of  $OPT(n)$ .
- ▶ To compute  $OPT(j)$ :
  - Case 1  $j \notin \mathcal{O}_j$ :  $OPT(j) = OPT(j - 1)$ .
  - Case 2  $j \in \mathcal{O}_j$ :  $OPT(j) = v_j + OPT(p(j))$

## Recursion

- ▶ Let  $\mathcal{O}_j$  be the optimal solution for jobs  $\{1, 2, \dots, j\}$  and  $OPT(j)$  be the value of this solution ( $OPT(0) = 0$ ).
- ▶ We are seeking  $\mathcal{O}_n$  with a value of  $OPT(n)$ .
- ▶ To compute  $OPT(j)$ :
  - Case 1  $j \notin \mathcal{O}_j$ :  $OPT(j) = OPT(j - 1)$ .
  - Case 2  $j \in \mathcal{O}_j$ :  $OPT(j) = v_j + OPT(p(j))$
- ▶ Final recurrence:

$$OPT(j) = \max(v_j + OPT(p(j)), OPT(j - 1))$$

## Recursion

- ▶ Let  $\mathcal{O}_j$  be the optimal solution for jobs  $\{1, 2, \dots, j\}$  and  $OPT(j)$  be the value of this solution ( $OPT(0) = 0$ ).
- ▶ We are seeking  $\mathcal{O}_n$  with a value of  $OPT(n)$ .
- ▶ To compute  $OPT(j)$ :
  - Case 1  $j \notin \mathcal{O}_j$ :  $OPT(j) = OPT(j - 1)$ .
  - Case 2  $j \in \mathcal{O}_j$ :  $OPT(j) = v_j + OPT(p(j))$
- ▶ Final recurrence:

$$OPT(j) = \max(v_j + OPT(p(j)), OPT(j - 1))$$

- ▶ To compute  $\mathcal{O}_j$ : when does request  $j$  belong to  $\mathcal{O}_j$ ?

## Recursion

- ▶ Let  $\mathcal{O}_j$  be the optimal solution for jobs  $\{1, 2, \dots, j\}$  and  $OPT(j)$  be the value of this solution ( $OPT(0) = 0$ ).
- ▶ We are seeking  $\mathcal{O}_n$  with a value of  $OPT(n)$ .
- ▶ To compute  $OPT(j)$ :
  - Case 1  $j \notin \mathcal{O}_j$ :  $OPT(j) = OPT(j - 1)$ .
  - Case 2  $j \in \mathcal{O}_j$ :  $OPT(j) = v_j + OPT(p(j))$
- ▶ Final recurrence:

$$OPT(j) = \max(v_j + OPT(p(j)), OPT(j - 1))$$

- ▶ To compute  $\mathcal{O}_j$ : when does request  $j$  belong to  $\mathcal{O}_j$ ? If and only if  $v_j + OPT(p(j)) \geq OPT(j - 1)$ .

# Recursive Algorithm

# Basic Outline of Dynamic Programming

- ▶ To solve a problem, we need a collection of sub-problems that satisfy a few properties:
  1. There are a polynomial number of sub-problems.
  2. The solution to the problem can be computed easily from the solutions to the sub-problems.
  3. There is a natural ordering of the sub-problems from “smallest” to “largest”.
  4. There is an easy-to-compute recurrence that allows us to compute the solution to a sub-problem from the solutions to some smaller sub-problems.

# Basic Outline of Dynamic Programming

- ▶ To solve a problem, we need a collection of sub-problems that satisfy a few properties:
  1. There are a polynomial number of sub-problems.
  2. The solution to the problem can be computed easily from the solutions to the sub-problems.
  3. There is a natural ordering of the sub-problems from “smallest” to “largest”.
  4. There is an easy-to-compute recurrence that allows us to compute the solution to a sub-problem from the solutions to some smaller sub-problems.
- ▶ Difficulties in designing dynamic programming algorithms:
  1. Which sub-problems to define?
  2. How can we tie together sub-problems using a recurrence?
  3. How do we order the sub-problems (to allow iterative computation of optimal solutions to sub-problems)?

# Least Squares Problem

Figure 6.6 A "line of best fit."

- ▶ Given scientific or statistical data plotted on two axes.
- ▶ Find the "best" line that "passes" through these points.

# Least Squares Problem

Figure 6.6 A "line of best fit."

## SEGMENTED LEAST SQUARES

**INSTANCE:** Set  $P = \{p_i = (x_i, y_i), 1 \leq i \leq n\}$  of  $n$  points,  
 $x_1 < x_2 < \dots < x_n$

**SOLUTION:** A integer  $k$ , a partition of  $P$  into  $k$  segments  
 $\{P_1, P_2, \dots, P_k\}$ ,  $k$  lines  $L_j : y = a_jx + b_j, 1 \leq j \leq k$  that minimise

$$\sum_{j=1}^k \text{Error}(L_j, P_j)$$

- ▶ A subset  $P'$  of  $P$  is a **segment** if  $1 \leq i < j \leq n$  exist such that  
 $P' = \{(x_i, y_i), (x_{i+1}, y_{i+1}), \dots, (x_{j-1}, y_{j-1}), (x_j, y_j)\}$ .

# Segmented Least Squares

Figure 6.7 A set of points that lie approximately on two lines.

Figure 6.8 A set of points that lie approximately on three lines.

## SEGMENTED LEAST SQUARES

**INSTANCE:** Set  $P = \{p_i = (x_i, y_i), 1 \leq i \leq n\}$  of  $n$  points,  $x_1 < x_2 < \dots < x_n$  and a parameter  $C > 0$ .

**SOLUTION:** A integer  $k$ , a partition of  $P$  into  $k$  segments  $\{P_1, P_2, \dots, P_k\}$ ,  $k$  lines  $L_j : y = a_j x + b_j, 1 \leq j \leq k$  that minimise

$$\sum_{j=1}^k \text{Error}(L_j, P_j) + Ck.$$

- ▶ A subset  $P'$  of  $P$  is a *segment* if  $1 \leq i < j \leq n$  exist such that  $P' = \{(x_i, y_i), (x_{i+1}, y_{i+1}), \dots, (x_{j-1}, y_{j-1}), (x_j, y_j)\}$ .

## Formulating the Recursion I

- ▶ Observation:  $p_n$  is part of some segment in the optimal solution. This segment starts at some point  $p_i$ .
- ▶ Let  $OPT(i)$  be the optimal value for the points  $\{p_1, p_2, \dots, p_i\}$ .
- ▶ Let  $e_{i,j}$  denote the minimum error of any line that fits  $\{p_i, p_2, \dots, p_j\}$ .
- ▶ We want to compute  $OPT(n)$ .

**Figure 6.9** A possible solution: a single line segment fits points  $p_i, p_{i+1}, \dots, p_n$ , and then an optimal solution is found for the remaining points  $p_1, p_2, \dots, p_{i-1}$ .

- ▶ If the last segment in the optimal partition is  $\{p_i, p_{i+1}, \dots, p_n\}$ , then

$$OPT(n) = e_{i,n} + C + OPT(i - 1)$$

## Formulating the Recursion II

- ▶ Consider the sub-problem on the points  $\{p_1, p_2, \dots, p_j\}$
- ▶ To obtain  $\text{OPT}(j)$ , if the last segment in the optimal partition is  $\{p_i, p_{i+1}, \dots, p_j\}$ , then

$$\text{OPT}(j) = e_{i,j} + C + \text{OPT}(i - 1)$$

## Formulating the Recursion II

- ▶ Consider the sub-problem on the points  $\{p_1, p_2, \dots, p_j\}$
- ▶ To obtain  $\text{OPT}(j)$ , if the last segment in the optimal partition is  $\{p_i, p_{i+1}, \dots, p_j\}$ , then

$$\text{OPT}(j) = e_{i,j} + C + \text{OPT}(i - 1)$$

- ▶ Since  $i$  can take only  $j$  distinct values,

$$\text{OPT}(j) = \min_{1 \leq i \leq j} (e_{i,j} + C + \text{OPT}(i - 1))$$

- ▶ Segment  $\{p_i, p_{i+1}, \dots, p_j\}$  is part of the optimal solution for this sub-problem if and only if the minimum value of  $\text{OPT}(j)$  is obtained using index  $i$ .

# Dynamic Programming Algorithm

$$\text{OPT}(j) = \min_{1 \leq i \leq j} (e_{i,j} + C + \text{OPT}(i - 1))$$

---

Segmented-Least-Squares(n)

Array  $M[0 \dots n]$

Set  $M[0] = 0$

For all pairs  $i \leq j$

    Compute the least squares error  $e_{i,j}$  for the segment  $p_i, \dots, p_j$

Endfor

For  $j = 1, 2, \dots, n$

    Use the recurrence (6.7) to compute  $M[j]$

Endfor

Return  $M[n]$

---

  2. if  $j$  pairs with some  $t < j - 4$ , compute  $OPT(i, t - 1)$  and  $OPT(t + 1, j - 1)$ .

$$OPT(i, j) = \max \left( OPT(i, j - 1), \right)$$

# Correct Dynamic Programming Approach

- ▶  $OPT(i, j)$  is the maximum number of base pairs in a secondary structure for  $b_i b_2 \dots b_j$ .  $OPT(i, j) = 0$ , if  $i \geq j - 4$ .
- ▶ In the optimal secondary structure on  $b_i b_2 \dots b_j$ 
  1. if  $j$  is not a member of any pair, compute  $OPT(i, j - 1)$ .
  2. if  $j$  pairs with some  $t < j - 4$ , compute  $OPT(i, t - 1)$  and  $OPT(t + 1, j - 1)$ .
- ▶ Since  $t$  can range from  $i$  to  $j - 5$ ,

$$OPT(i, j) = \max \left( OPT(i, j - 1), \right)$$

## Correct Dynamic Programming Approach

- ▶  $OPT(i, j)$  is the maximum number of base pairs in a secondary structure for  $b_i b_2 \dots b_j$ .  $OPT(i, j) = 0$ , if  $i \geq j - 4$ .
- ▶ In the optimal secondary structure on  $b_i b_2 \dots b_j$ 
  1. if  $j$  is not a member of any pair, compute  $OPT(i, j - 1)$ .
  2. if  $j$  pairs with some  $t < j - 4$ , compute  $OPT(i, t - 1)$  and  $OPT(t + 1, j - 1)$ .
- ▶ Since  $t$  can range from  $i$  to  $j - 5$ ,

$$OPT(i, j) = \max \left( OPT(i, j - 1), \max_t (1 + OPT(i, t - 1) + OPT(t + 1, j - 1)) \right)$$

## Correct Dynamic Programming Approach

- ▶  $OPT(i, j)$  is the maximum number of base pairs in a secondary structure for  $b_i b_2 \dots b_j$ .  $OPT(i, j) = 0$ , if  $i \geq j - 4$ .
- ▶ In the optimal secondary structure on  $b_i b_2 \dots b_j$ 
  1. if  $j$  is not a member of any pair, compute  $OPT(i, j - 1)$ .
  2. if  $j$  pairs with some  $t < j - 4$ , compute  $OPT(i, t - 1)$  and  $OPT(t + 1, j - 1)$ .
- ▶ Since  $t$  can range from  $i$  to  $j - 5$ ,

$$OPT(i, j) = \max \left( OPT(i, j - 1), \max_t (1 + OPT(i, t - 1) + OPT(t + 1, j - 1)) \right)$$

- ▶ In the “inner” maximisation,  $t$  runs over all indices between  $i$  and  $j - 5$  that are allowed to pair with  $j$ .

# Dynamic Programming Algorithm

$$\text{OPT}(i, j) = \max \left( \text{OPT}(i, j - 1), \max_t (1 + \text{OPT}(i, t - 1) + \text{OPT}(t + 1, j - 1)) \right)$$

- ▶ There are  $O(n^2)$  sub-problems.
- ▶ How do we order them from “smallest” to “largest”?

# Dynamic Programming Algorithm

$$\text{OPT}(i, j) = \max \left( \text{OPT}(i, j - 1), \max_t (1 + \text{OPT}(i, t - 1) + \text{OPT}(t + 1, j - 1)) \right)$$

- ▶ There are  $O(n^2)$  sub-problems.
- ▶ How do we order them from “smallest” to “largest”?
- ▶ Note that computing  $\text{OPT}(i, j)$  involves sub-problems  $\text{OPT}(l, m)$  where  $m - l < j - i$ .

# Dynamic Programming Algorithm

$$\text{OPT}(i, j) = \max \left( \text{OPT}(i, j - 1), \max_t (1 + \text{OPT}(i, t - 1) + \text{OPT}(t + 1, j - 1)) \right)$$

- ▶ There are  $O(n^2)$  sub-problems.
- ▶ How do we order them from “smallest” to “largest”?
- ▶ Note that computing  $\text{OPT}(i, j)$  involves sub-problems  $\text{OPT}(l, m)$  where  $m - l < j - i$ .

---

```

Initialize  $\text{OPT}(i, j) = 0$  whenever  $i \geq j - 4$ 
For  $k = 5, 6, \dots, n - 1$ 
  For  $i = 1, 2, \dots, n - k$ 
    Set  $j = i + k$ 
    Compute  $\text{OPT}(i, j)$  using the recurrence in (6.13)
  Endfor
Endfor
Return  $\text{OPT}(1, n)$ 

```

---

# Dynamic Programming Algorithm

$$\text{OPT}(i, j) = \max \left( \text{OPT}(i, j - 1), \max_t (1 + \text{OPT}(i, t - 1) + \text{OPT}(t + 1, j - 1)) \right)$$

- ▶ There are  $O(n^2)$  sub-problems.
- ▶ How do we order them from “smallest” to “largest”?
- ▶ Note that computing  $\text{OPT}(i, j)$  involves sub-problems  $\text{OPT}(l, m)$  where  $m - l < j - i$ .

---

```

Initialize  $\text{OPT}(i, j) = 0$  whenever  $i \geq j - 4$ 
For  $k = 5, 6, \dots, n - 1$ 
  For  $i = 1, 2, \dots, n - k$ 
    Set  $j = i + k$ 
    Compute  $\text{OPT}(i, j)$  using the recurrence in (6.13)
  Endfor
Endfor
Return  $\text{OPT}(1, n)$ 

```

---

- ▶ Running time of the algorithm is  $O(n^3)$ .

- ▶ How do they know “Dynamic” and “Dymanic” are similar?

# Sequence Similarity

- ▶ Given two strings, measure how similar they are.
- ▶ Given a database of strings and a query string, compute the string most similar to query in the database.
- ▶ Applications:
  - ▶ Online searches (Web, dictionary).
  - ▶ Spell-checkers.
  - ▶ Computational biology
  - ▶ Speech recognition.
  - ▶ Basis for Unix `diff`.

  - ▶ Edges from node  $(i, j)$  to  $(i, j + 1)$ , to  $(i + 1, j)$ , and to  $(i + 1, j + 1)$ .
  - ▶ Edges directed upward and to the right have cost  $\delta$ .
  - ▶ Edge directed from  $(i, j)$  to  $(i + 1, j + 1)$  has cost  $\alpha_{x_{i+1}y_{j+1}}$ .
- ▶  $f(i, j)$ : minimum cost of a path in  $G_{XY}$  from  $(0, 0)$  to  $(i, j)$ .
- ▶ Claim:  $f(i, j) = \text{OPT}(i, j)$  and diagonal edges in the shortest path are the matched pairs in the alignment.

# Motivation

- ▶ Computational finance:
  - ▶ Each node is a financial agent.
  - ▶ The cost  $c_{uv}$  of an edge  $(u, v)$  is the cost of a transaction in which we buy from agent  $u$  and sell to agent  $v$ .
  - ▶ Negative cost corresponds to a profit.
- ▶ Internet routing protocols
  - ▶ Dijkstra's algorithm needs knowledge of the entire network.
  - ▶ Routers only know which other routers they are connected to.
  - ▶ Algorithm for shortest paths with negative edges is decentralised.
  - ▶ We will not study this algorithm in the class. See Chapter 6.9.

## Problem Statement

- ▶ Input: a directed graph  $G = (V, E)$  with a cost function  $c : E \rightarrow \mathbb{R}$ , i.e.,  $c_{uv}$  is the cost of the edge  $(u, v) \in E$ .
- ▶ A *negative cycle* is a directed cycle whose edges have a total cost that is negative.
- ▶ Two related problems:
  1. If  $G$  has no negative cycles, find the *shortest  $s$ - $t$  path*: a path of from source  $s$  to destination  $t$  with minimum total cost.
  2. Does  $G$  have a *negative cycle*?

## Problem Statement

- ▶ Input: a directed graph  $G = (V, E)$  with a cost function  $c : E \rightarrow \mathbb{R}$ , i.e.,  $c_{uv}$  is the cost of the edge  $(u, v) \in E$ .
- ▶ A *negative cycle* is a directed cycle whose edges have a total cost that is negative.
- ▶ Two related problems:
  1. If  $G$  has no negative cycles, find the *shortest  $s$ - $t$  path*: a path of from source  $s$  to destination  $t$  with minimum total cost.
  2. Does  $G$  have a *negative cycle*?

**Figure 6.20** In this graph, one can find  $s$ - $t$  paths of arbitrarily negative cost (by going around the cycle  $C$  many times).

# Approaches for Shortest Path Algorithm

1. Dijkstra's algorithm.
2. Add some large constant to each edge.

# Approaches for Shortest Path Algorithm

1. Dijkstra's algorithm. Computes incorrect answers because it is greedy.
2. Add some large constant to each edge. Computes incorrect answers because the minimum cost path changes.

(a)

(b)

**Figure 6.21** (a) With negative edge costs, Dijkstra's Algorithm can give the wrong answer for the Shortest-Path Problem. (b) Adding 3 to the cost of each edge will make all edges nonnegative, but it will change the identity of the shortest  $s-t$  path.

# Dynamic Programming Approach

- ▶ Assume  $G$  has no negative cycles.
- ▶ Claim: There is a shortest path from  $s$  to  $t$  that is *simple* (does not repeat a node)

# Dynamic Programming Approach

- ▶ Assume  $G$  has no negative cycles.
- ▶ Claim: There is a shortest path from  $s$  to  $t$  that is *simple* (does not repeat a node) and hence has at most  $n - 1$  edges.

# Dynamic Programming Approach

- ▶ Assume  $G$  has no negative cycles.
- ▶ Claim: There is a shortest path from  $s$  to  $t$  that is *simple* (does not repeat a node) and hence has at most  $n - 1$  edges.
- ▶ How do we define sub-problems?

# Dynamic Programming Approach

- ▶ Assume  $G$  has no negative cycles.
- ▶ Claim: There is a shortest path from  $s$  to  $t$  that is *simple* (does not repeat a node) and hence has at most  $n - 1$  edges.
- ▶ How do we define sub-problems?
  - ▶ Shortest  $s-t$  path has  $\leq n - 1$  edges: how we can reach  $t$  using  $i$  edges, for different values of  $i$ ?
  - ▶ We do not know which nodes will be in shortest  $s-t$  path: how we can reach  $t$  from each node in  $V$ ?

# Dynamic Programming Approach

- ▶ Assume  $G$  has no negative cycles.
- ▶ Claim: There is a shortest path from  $s$  to  $t$  that is *simple* (does not repeat a node) and hence has at most  $n - 1$  edges.
- ▶ How do we define sub-problems?
  - ▶ Shortest  $s$ - $t$  path has  $\leq n - 1$  edges: how we can reach  $t$  using  $i$  edges, for different values of  $i$ ?
  - ▶ We do not know which nodes will be in shortest  $s$ - $t$  path: how we can reach  $t$  from each node in  $V$ ?
- ▶ Sub-problems defined by varying the number of edges in the shortest path and by varying the starting node in the shortest path.

# Dynamic Programming Recursion

- ▶  $OPT(i, v)$ : minimum cost of a  $v$ - $t$  path that uses **at most**  $i$  edges.
- ▶  $t$  is not explicitly mentioned in the sub-problems.
- ▶ Goal is to compute  $OPT(n - 1, s)$ .

## Dynamic Programming Recursion

- ▶  $OPT(i, v)$ : minimum cost of a  $v$ - $t$  path that uses **at most**  $i$  edges.
- ▶  $t$  is not explicitly mentioned in the sub-problems.
- ▶ Goal is to compute  $OPT(n - 1, s)$ .

Figure 6.22 The minimum-cost path  $P$  from  $v$  to  $t$  using at most  $i$  edges.

- ▶ Let  $P$  be the optimal path whose cost is  $OPT(i, v)$ .

## Dynamic Programming Recursion

- ▶  $OPT(i, v)$ : minimum cost of a  $v$ - $t$  path that uses **at most**  $i$  edges.
- ▶  $t$  is not explicitly mentioned in the sub-problems.
- ▶ Goal is to compute  $OPT(n - 1, s)$ .

Figure 6.22 The minimum-cost path  $P$  from  $v$  to  $t$  using at most  $i$  edges.

- ▶ Let  $P$  be the optimal path whose cost is  $OPT(i, v)$ .
  1. If  $P$  actually uses  $i - 1$  edges, then  $OPT(i, v) = OPT(i - 1, v)$ .
  2. If first node on  $P$  is  $w$ , then  $OPT(i, v) = c_{vw} + OPT(i - 1, w)$ .

## Dynamic Programming Recursion

- ▶  $OPT(i, v)$ : minimum cost of a  $v$ - $t$  path that uses **at most**  $i$  edges.
- ▶  $t$  is not explicitly mentioned in the sub-problems.
- ▶ Goal is to compute  $OPT(n - 1, s)$ .

Figure 6.22 The minimum-cost path  $P$  from  $v$  to  $t$  using at most  $i$  edges.

# Computing the Shortest Path: Cycles in $P$

$$M[v] = \min \left( M'[v], \min_{w \in N_v} (c_{vw} + M'[w]) \right)$$

- ▶ Claim: If  $P$  has a cycle  $C$ , then  $C$  has negative cost.

# Computing the Shortest Path: Cycles in $P$

$$M[v] = \min \left( M'[v], \min_{w \in N_v} (c_{vw} + M'[w]) \right)$$

- ▶ Claim: If  $P$  has a cycle  $C$ , then  $C$  has negative cost.
  - ▶ Suppose we set  $f(v) = w$ . Between this assignment and the assignment of  $f(v)$  to some other node,  $M[v] \geq c_{vw} + M[w]$  (because  $M[w]$  may itself decrease).

# Computing the Shortest Path: Cycles in $P$

$$M[v] = \min \left( M'[v], \min_{w \in N_v} (c_{vw} + M'[w]) \right)$$

- ▶ Claim: If  $P$  has a cycle  $C$ , then  $C$  has negative cost.
  - ▶ Suppose we set  $f(v) = w$ . Between this assignment and the assignment of  $f(v)$  to some other node,  $M[v] \geq c_{vw} + M[w]$  (because  $M[w]$  may itself decrease).
  - ▶ Let  $v_1, v_2, \dots, v_k$  be the nodes in  $C$  and assume that  $(v_k, v_1)$  is the last edge to have been added.
  - ▶ What is the situation just before this addition?

# Computing the Shortest Path: Cycles in $P$

$$M[v] = \min \left( M'[v], \min_{w \in N_v} (c_{vw} + M'[w]) \right)$$

- ▶ Claim: If  $P$  has a cycle  $C$ , then  $C$  has negative cost.
  - ▶ Suppose we set  $f(v) = w$ . Between this assignment and the assignment of  $f(v)$  to some other node,  $M[v] \geq c_{vw} + M[w]$  (because  $M[w]$  may itself decrease).
  - ▶ Let  $v_1, v_2, \dots, v_k$  be the nodes in  $C$  and assume that  $(v_k, v_1)$  is the last edge to have been added.
  - ▶ What is the situation just before this addition?
  - ▶  $M[v_i] - M[v_{i+1}] \geq c_{v_i v_{i+1}}$ , for all  $1 \leq i < k - 1$ .
  - ▶  $M[v_k] - M[v_1] > c_{v_k v_1}$ .

# Computing the Shortest Path: Cycles in $P$

$$M[v] = \min \left( M'[v], \min_{w \in N_v} (c_{vw} + M'[w]) \right)$$

- ▶ Claim: If  $P$  has a cycle  $C$ , then  $C$  has negative cost.
  - ▶ Suppose we set  $f(v) = w$ . Between this assignment and the assignment of  $f(v)$  to some other node,  $M[v] \geq c_{vw} + M[w]$  (because  $M[w]$  may itself decrease).
  - ▶ Let  $v_1, v_2, \dots, v_k$  be the nodes in  $C$  and assume that  $(v_k, v_1)$  is the last edge to have been added.
  - ▶ What is the situation just before this addition?
  - ▶  $M[v_i] - M[v_{i+1}] \geq c_{v_i v_{i+1}}$ , for all  $1 \leq i < k - 1$ .
  - ▶  $M[v_k] - M[v_1] > c_{v_k v_1}$ .
  - ▶ Adding all these inequalities,  $0 > \sum_{i=1}^{k-1} c_{v_i v_{i+1}} + c_{v_k v_1} = \text{cost of } C$ .

# Computing the Shortest Path: Cycles in $P$

$$M[v] = \min \left( M'[v], \min_{w \in N_v} (c_{vw} + M'[w]) \right)$$

- ▶ Claim: If  $P$  has a cycle  $C$ , then  $C$  has negative cost.
  - ▶ Suppose we set  $f(v) = w$ . Between this assignment and the assignment of  $f(v)$  to some other node,  $M[v] \geq c_{vw} + M[w]$  (because  $M[w]$  may itself decrease).
  - ▶ Let  $v_1, v_2, \dots, v_k$  be the nodes in  $C$  and assume that  $(v_k, v_1)$  is the last edge to have been added.
  - ▶ What is the situation just before this addition?
  - ▶  $M[v_i] - M[v_{i+1}] \geq c_{v_i v_{i+1}}$ , for all  $1 \leq i < k - 1$ .
  - ▶  $M[v_k] - M[v_1] > c_{v_k v_1}$ .
  - ▶ Adding all these inequalities,  $0 > \sum_{i=1}^{k-1} c_{v_i v_{i+1}} + c_{v_k v_1} = \text{cost of } C$ .
- ▶ Corollary: if  $G$  has no negative cycles that  $P$  does not either.

## Computing the Shortest Path: Paths in $P$

- ▶ Let  $P$  be the pointer graph upon termination of the algorithm.
- ▶ Consider the path  $P_v$  in  $P$  obtained by following the pointers from  $v$  to  $f(v) = v_1$ , to  $f(v_1) = v_2$ , and so on.

## Computing the Shortest Path: Paths in $P$

- ▶ Let  $P$  be the pointer graph upon termination of the algorithm.
- ▶ Consider the path  $P_v$  in  $P$  obtained by following the pointers from  $v$  to  $f(v) = v_1$ , to  $f(v_1) = v_2$ , and so on.
- ▶ Claim:  $P_v$  terminates at  $t$ .

## Computing the Shortest Path: Paths in $P$

- ▶ Let  $P$  be the pointer graph upon termination of the algorithm.
- ▶ Consider the path  $P_v$  in  $P$  obtained by following the pointers from  $v$  to  $f(v) = v_1$ , to  $f(v_1) = v_2$ , and so on.
- ▶ Claim:  $P_v$  terminates at  $t$ .
- ▶ Claim:  $P_v$  is the shortest path in  $G$  from  $v$  to  $t$ .

# Bellman-Ford Algorithm: Early Termination

$$M[v] = \min \left( M'[v], \min_{w \in N_v} (c_{vw} + M'[w]) \right)$$

- ▶ In general, after  $i$  iterations, the path whose length is  $M[v]$  may have many more than  $i$  edges.

# Bellman-Ford Algorithm: Early Termination

$$M[v] = \min \left( M'[v], \min_{w \in N_v} (c_{vw} + M'[w]) \right)$$

- ▶ In general, after  $i$  iterations, the path whose length is  $M[v]$  may have many more than  $i$  edges.
- ▶ Early termination: If  $M$  equals  $N$  after processing all the nodes, we have computed all the shortest paths to  $t$ .
