CS 4604: Introduction to Database Management Systems

B. Aditya Prakash

Lecture #9: Hashing and Sorting
(Static) Hashing

- Problem: “find EMP record with ssn=123”
- What if disk space was free, and time was at premium?
A: Brilliant idea: key-to-address transformation:

Hashing

123; Smith; Main str

#0 page

#123 page

#999,999,999
Hashing

- Since space is NOT free:
- use M, instead of 999,999,999 slots
- hash function: \( h(\text{key}) = \text{slot-id} \)
Hashing

- Typically: each hash bucket is a page, holding many records:

```
123; Smith; Main str
```

```
#0 page
#h(123)
```

```
M
```
Hashing

- Notice: could have clustering, or non-clustering versions:

123; Smith; Main str.
Hashing

- Notice: could have clustering, or non-clustering versions:

```
#0 page
#h(123) M

EMP file
...
234; Johnson; Forbes ave
123; Smith; Main str.
345; Tompson; Fifth ave
...```

Prakash 2015
VT CS 4604
Design decisions

- 1) formula h() for hashing function
- 2) size of hash table M
- 3) collision resolution method
Design decisions - functions

- Goal: uniform spread of keys over hash buckets
- Popular choices:
  - Division hashing
  - Multiplication hashing
Division hashing

- $h(x) = (a \cdot x + b) \mod M$
- eg., $h(ssn) = (ssn) \mod 1,000$
  - gives the last three digits of ssn
- $M$: size of hash table - choose a prime number, defensively (why?)
Division hashing

- eg., $M=2$; hash on driver-license number (dln), where last digit is ‘gender’ (0/1 = M/F)

- in an army unit with predominantly male soldiers

- Thus: avoid cases where $M$ and keys have common divisors - prime $M$ guards against that!
Multiplication hashing

\[ h(x) = \lfloor \text{fractional-part-of} \ ( x \times \varphi ) \rfloor \times M \]

- \( \varphi \): golden ratio \( (0.618... = (\sqrt{5}-1)/2) \)
- in general, we need an irrational number
- advantage: \( M \) need not be a prime number
- but \( \varphi \) must be irrational
Other hashing functions

- quadratic hashing (bad)
- ...

Prakash 2015
Other hashing functions

- quadratic hashing (bad)
- ...
- conclusion: use division hashing
Size of hash table

- eg., 50,000 employees, 10 employee-records / page

- Q: $M = \text{?? pages/buckets/slots}$
Size of hash table

- eg., 50,000 employees, 10 employees/page
- Q: \( M = ? \) pages/buckets/slots
- A: utilization \( \sim 90\% \) and
  - \( M \): prime number

Eg., in our case: \( M = \) closest prime to \( 50,000/10 \times 0.9 = 5,555 \)
Collision resolution

- Q: what is a ‘collision’?
- A: ??
Collision resolution

123; Smith; Main str. → #h(123) → FULL → #0 page
Collision resolution

- Q: what is a ‘collision’?
- A: ??

- Q: why worry about collisions/overflows? (recall that buckets are ~90% full)
- A: ‘birthday paradox’
Collision resolution

- open addressing
  - linear probing (ie., put to next slot/bucket)
  - re-hashing
- separate chaining (ie., put links to overflow pages)
Collision resolution

linear probing:

123; Smith; Main str.

#0 page

#h(123)

M
Collision resolution

re-hashing

123; Smith; Main str.

h1()

h2()

#0 page

#h(123)

M
Collision resolution

separate chaining

123; Smith; Main str.
Design decisions - conclusions

- function: division hashing
  - $h(x) = (a \cdot x + b) \mod M$
- size $M$: ~90% util.; prime number.
- collision resolution: separate chaining
  - easier to implement (deletions!);
  - no danger of becoming full
Problem with static hashing

- problem: overflow?
- problem: underflow? (underutilization)
Solution: Dynamic/extendible hashing

- idea: shrink / expand hash table on demand..
- ..dynamic hashing
- Details: how to grow gracefully, on overflow?
- Many solutions - One of them: ‘extendible hashing’ [Fagin et al]
Extendible hashing

123; Smith; Main str. → #h(123) → #0 page

M

Prakash 2015
Extendible hashing

solution:

split the bucket in two

123; Smith; Main str.
Extendible hashing

in detail:
- keep a directory, with ptrs to hash-buckets
- Q: how to divide contents of bucket in two?
- A: hash each key into a very long bit string; keep only as many bits as needed

Eventually:

Extendible hashing

- Summary: directory doubles on demand or halves, on shrinking files
- needs ‘local’ and ‘global’ depth
Linear hashing - overview

- Motivation
- main idea
- search algo
- insertion/split algo
- deletion
Linear hashing

- Motivation: ext. hashing needs directory etc etc; which doubles (ouch!)
- Q: can we do something simpler, with smoother growth?

Prakash 2015
Linear hashing

- Motivation: ext. hashing needs directory etc etc; which doubles (ouch!)
- Q: can we do something simpler, with smoother growth?
- A: split buckets from left to right, regardless of which one overflowed ('crazy', but it works well!) - Eg.:
Linear hashing

Initially: \( h(x) = x \mod N \) (\( N=4 \) here)

Assume capacity: 3 records / bucket

Insert key ‘17’
Initially: $h(x) = x \mod N$  (N=4 here)

bucket- id

0  1  2  3  

4  8  5  9  6  7  11

overflow of bucket#1
Initially: $h(x) = x \mod N$  \hfill (N=4 here)

overflow of bucket#1

Split #0, anyway!!!
Initially: $h(x) = x \mod N$ (N=4 here)

Split #0, anyway!!!

Q: But, how?
Linear hashing

A: use two h.f.: \( h_0(x) = x \mod N \)
\( h_1(x) = x \mod (2*N) \)
Linear hashing - after split:

A: use two h.f.: \( h_0(x) = x \mod N \)
\[ h_1(x) = x \mod (2*N) \]
Linear hashing - after split:

A: use two h.f.: 

\[ h_0(x) = x \mod N \]

\[ h_1(x) = x \mod (2*N) \]
Linear hashing - after split:

A: use two h.f.: $h_0(x) = x \mod N$

$h_1(x) = x \mod (2*N)$
Linear hashing - searching?

\[ h_0(x) = x \mod N \quad (\text{for the un-split buckets}) \]
\[ h_1(x) = x \mod (2*N) \quad (\text{for the splitted ones}) \]
Linear hashing - searching?

Q1: find key ‘6’?

Q2: find key ‘4’?

Q3: key ‘8’?

bucket-id

split ptr

0 1 2 3 4

8 5 9 4

13 6 7 11

17

overflow
Linear hashing - searching?

Algo to find key ‘k’:

• compute $b = h_0(k)$;
  • if $b < \text{split-ptr}$, compute $b = h_1(k)$
• search bucket $b$
Linear hashing - insertion?

Algo: insert key ‘k’

• compute appropriate bucket ‘b’
• if the **overflow criterion** is true
  • split the bucket of ‘split-ptr’
  • split-ptr ++ (*)
Linear hashing - insertion?

- notice: overflow criterion is up to us!!
- Q: suggestions?
Linear hashing - insertion?

- notice: overflow criterion is up to us!!
- Q: suggestions?
- A1: space utilization >= u-max
Linear hashing - insertion?

- notice: overflow criterion is up to us!!
- Q: suggestions?
  - A1: space utilization > u-max
  - A2: avg length of ovf chains > max-len
  - A3: ....
Linear hashing - insertion?

Algo: insert key ‘k’

• compute appropriate bucket ‘b’

• if the **overflow criterion** is true
  
  • split the bucket of ‘split-ptr’
  
  • split-ptr ++ (*)

what if we reach the right edge??
Linear hashing - split now?

\[ h_0(x) = x \mod N \quad \text{(for the un-split buckets)} \]
\[ h_1(x) = x \mod (2N) \quad \text{for the splitted ones} \]
Linear hashing - split now?

\[ h_0(x) = x \mod N \quad \text{(for the un-split buckets)} \]
\[ h_1(x) = x \mod (2N) \quad \text{(for the splitted ones)} \]
Linear hashing - split now?

\[ h_0(x) = x \mod N \] (for the un-split buckets)
\[ h_1(x) = x \mod (2 \times N) \] (for the splitted ones)

split ptr

\begin{center}
\begin{tabular}{cccccccc}
0 & 1 & 2 & 3 & 4 & 5 & 6 & 7
\end{tabular}
\end{center}
Linear hashing - split now?

\[ h_0(x) = x \mod N \]  
(for the un-split buckets)

\[ h_1(x) = x \mod (2 \times N) \]  
(for the splitted ones)

split ptr

\begin{align*}
\text{bucket 0} & \quad \text{bucket 1} & \quad \text{bucket 2} & \quad \text{bucket 3} & \quad \text{bucket 4} & \quad \text{bucket 5} & \quad \text{bucket 6} & \quad \text{bucket 7}
\end{align*}
Linear hashing - split now?

this state is called ‘full expansion’
In general, at any point of time, we have at most two h.f. active, of the form:

- $h_n(x) = x \mod (N \times 2^n)$
- $h_{n+1}(x) = x \mod (N \times 2^{n+1})$

(after a full expansion, we have only one h.f.)
Linear hashing - deletion?

- reverse of insertion:
Linear hashing - deletion?

- reverse of insertion:
- if the underflow criterion is met
  – contract!
Linear hashing - how to contract?

\[ h_0(x) = \text{mod } N \quad \text{(for the un-split buckets)} \]
\[ h_1(x) = \text{mod } (2*N) \quad \text{(for the split ones)} \]
Linear hashing - how to contract?

\[ h_0(x) = \text{mod } N \quad (\text{for the un-split buckets}) \quad h_1(x) = \text{mod } (2\times N) \quad (\text{for the splitted ones}) \]
Hashing - pros?
Hashing - pros?

- Speed,
  - on exact match queries
  - on the average
B(+) - trees - pros?
B(+) - trees - pros?

- Speed on search:
  - exact match queries, worst case
  - range queries
  - nearest-neighbor queries
- Speed on insertion + deletion
- smooth growing and shrinking (no re-org)
Conclusions

- B-trees and variants: in all DBMSs
- hash indices: in some
  - (but hashing in useful for joins...)

Prakash 2015
SORTING
Why Sort?
Why Sort?

- `select ... order by`
  
  - e.g., find students in increasing `gpa` order

- `bulk loading` B+ tree index.

- `duplicate elimination` (select distinct)

- `select ... group by`

- `Sort-merge` join algorithm involves sorting.
Outline

- two-way merge sort
- external merge sort
- fine-tunings
- B+ trees for sorting
2-Way Sort: Requires 3 Buffers

- Pass 0: Read a page, sort it, write it.
  - only one buffer page is used
- Pass 1, 2, 3, ..., etc.: requires 3 buffer pages
  - merge pairs of runs into runs twice as long
  - three buffer pages used.

Diagram:
- Disk
- Main memory buffers
- INPUT 1
- INPUT 2
- OUTPUT
- Disk
- Each pass we read + write each page in file.

Input file

Each pass we read + write each page in file.
Two-Way External Merge Sort

- Each pass we read + write each page in file.
Two-Way External Merge Sort

- Each pass we read + write each page in file.
Two-Way External Merge Sort

- Each pass we read + write each page in file.
- $N$ pages in the file $\Rightarrow$
  
  $= \lceil \log_2 N \rceil + 1$
- So total cost is:

  $$2N\left(\lceil \log_2 N \rceil + 1\right)$$

- Idea: Divide and conquer: sort subfiles and merge

![Diagram of Two-Way External Merge Sort]
External merge sort

B > 3 buffers

- Q1: how to sort?
- Q2: cost?
General External Merge Sort

B > 3 buffer pages. How to sort a file with N pages?
General External Merge Sort

- Pass 0: use $B$ buffer pages. Produce $\lceil \frac{N}{B} \rceil$ sorted runs of $B$ pages each.
- Pass 1, 2, ..., etc.: merge $B-1$ runs.
Sorting

– create sorted runs of size B (how many?)
– merge them (how?)

B

...
Sorting

– create sorted runs of size $B$
– merge first $B-1$ runs into a sorted run of $(B-1) \times B$, ...

\[ B \uparrow \downarrow \begin{array}{c}
\vdots \\
\vdots \\
\vdots \\
\end{array}
\begin{array}{c}
\downarrow \\
\downarrow \\
\downarrow \\
\end{array}
\begin{array}{c}
\vdots \\
\vdots \\
\vdots \\
\end{array}
\begin{array}{c}
\downarrow \\
\downarrow \\
\downarrow \\
\end{array}
\begin{array}{c}
\vdots \\
\vdots \\
\vdots \\
\end{array}
\begin{array}{c}
\downarrow \\
\downarrow \\
\downarrow \\
\end{array} \ldots \ldots \ldots \ldots \downarrow \]
Sorting

– How many steps we need to do? ‘i’, where \( B^i (B-1)^i > N \)
– How many reads/writes per step? \( N+N \)
Cost of External Merge Sort

- Number of passes: \( 1 + \lceil \log_{B - 1} \left[ \frac{N}{B} \right] \rceil \)
- Cost = \( 2N \times \text{(# of passes)} \)
Cost of External Merge Sort

- E.g., with 5 buffer pages, to sort 108 page file:
  - Pass 0: \( \lceil \frac{108}{5} \rceil = 22 \) sorted runs of 5 pages each (last run is only 3 pages)
  - Pass 1: \( \lceil \frac{22}{4} \rceil = 6 \) sorted runs of 20 pages each (last run is only 8 pages)
  - Pass 2: 2 sorted runs, 80 pages and 28 pages
  - Pass 3: Sorted file of 108 pages

Formula check: \( \lceil \log_4 22 \rceil = 3 \ldots + 1 \implies 4 \text{ passes} \ \checkmark \)
### Number of Passes of External Sort

(I/O cost is $2N$ times number of passes)

Internal Sort Algorithm

- Quicksort is a fast way to sort in memory.
Blocked I/O & double-buffering

- So far, we assumed random disk access
- Cost changes, if we consider that runs are written (and read) sequentially
- What could we do to exploit it?
Blocked I/O & double-buffering

- So far, we assumed random disk access
- Cost changes, if we consider that runs are written (and read) sequentially
- What could we do to exploit it?
- A1: Blocked I/O (exchange a few r.d.a for several sequential ones)
- A2: double-buffering
Double Buffering

- To reduce wait time for I/O request to complete, can \textit{prefetch} into `\texttt{shadow block}'.

  - Potentially, more passes; in practice, most files still sorted in 2-3 passes.
Using B+ Trees for Sorting

- Scenario: Table to be sorted has B+ tree index on sorting column(s).
- **Idea:** Can retrieve records in order by traversing leaf pages.
- *Is this a good idea?*
- Cases to consider:
  - B+ tree is **clustered**
  - B+ tree is **not clustered**
Using B+ Trees for Sorting

- **Scenario:** Table to be sorted has B+ tree index on sorting column(s).
- **Idea:** Can retrieve records in order by traversing leaf pages.
- **Is this a good idea?**

**Cases to consider:**
- B+ tree is **clustered**  
  Good idea!
- B+ tree is **not clustered** Could be a very bad idea!
Clustered B+ Tree Used for Sorting

- Cost: root to the left-most leaf, then retrieve all leaf pages (Alternative 1)

Always better than external sorting!
Alternative (2) for data entries; each data entry contains \textit{rid} of a data record. In general, \textit{one I/O per data record}!
## External Sorting vs. Unclustered Index

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

\( p \): # of records per page

\( B = 1,000 \) and block size = 32 for sorting

\( p = 100 \) is the more realistic value.
Summary

- External sorting is important
- External merge sort minimizes disk I/O cost:
  - Pass 0: Produces sorted \textit{runs} of size \textit{B} (\# buffer pages).
  - Later passes: \textit{merge} runs.
- Clustered B+ tree is good for sorting; unclustered tree is usually very bad.
