

# Image Classification & Evaluation by Machine Learning Mini-Project Presentation

CS5804 Introduction to AI Spring 2022

# Team Members

Atsushi Ikeda - M.Eng student

Major: Computer Science and Application

Interests: Machine Learning, Deep Learning

Jong Heon Kim - M.Eng student

Major: Computer Science and Application

Interests: Machine Learning, Security

# Problem Description

**Image classification** - one of the major research areas of AI

## Problem we tackled:

- *Implement* multiple machine learning algorithms to predict the correct digits for handwritten digits in the MNIST dataset
- *Evaluate* and compare their performances
- Lessons learned from the process

# Approaches - Dataset

## MNIST Dataset

- Include 60,000 handwritten digit images for training
- Include 10,000 test images
- With the true label of the handwritten digit "0-9"

# Approaches - Implemented Models

- **K-Nearest Neighbors (KNN)**
- **Neural Network**
- **K-means based classifier**

# Approaches - Performance Evaluation Metrics

**Accuracy:** Closeness of measurements to the true value

**Precision:** The fraction of a cluster that consists of objects of a specified class

**Recall:** The extent to which a cluster contains all objects of a specified class

**F1-score:** Harmonic mean of the Precision and Recall

		Predicted			
		+	-		
Actual	+	TP Type II error	FN Type I error	Sensitivity (recall) TP/●	False negative rate FN/●
	-	FP Type I error	TN	False positive rate FP/●	Specificity TN/●
Precision		TP/■	False omission rate FN/■	Accuracy (TP + TN)/(● + ●)	
FDR		FP/■	Negative predictive value TN/■	F <sub>1</sub> score 2TP/(2TP + FP + FN)

# K-Nearest Neighbors (KNN)

- refers to the k training examples that are close to a test instance, given the test instance
- In this experiment, we use  $k=245$ , and euclidean distance

## Performance evaluation:

<b>Accuracy</b>	<b>0.924</b>
<b>Precision</b>	<b>0.93</b>
<b>Recall</b>	<b>0.923</b>
<b>F1-score</b>	<b>0.924</b>

# Neural Network

- build a simple neural network model
- Input layer is the linear transform layer of [784, 10]
- Next layer is the ReLU layer of [10, 10]
- Output layer is the softmax and cross entropy loss layer

## Neural Network (Cont.)

- In this experiment, we set dropout probability to 0.25
- Optimizer is SGD with a Learning Rate=0.0001
- Epoch=100, Batch\_size=32

### Performance evaluation:

<b>Accuracy</b>	<b>0.802</b>
<b>Precision</b>	<b>0.889</b>
<b>Recall</b>	<b>0.857</b>
<b>F1-score</b>	<b>0.873</b>

# Neural Network (Cont.)

Training and Test Loss

Training and Test Accuracy

Test Precision

Test Recall

Test F1-score

# K-means Clustering based Classifier

- Classifier not based on supervised learning
- Unseen image can be classified through:
  1. Form clusters based on the similarity of  $28 \times 28$  pixel values (updating centroids of each cluster until no centroids change)
  2. Make each cluster as a label (digit number)
  3. Compute similarity between new unseen data and centroids of all clusters
  4. Predict a label of unseen data by choosing the label of the cluster whose centroid is most similar to unseen data's pixel value (lowest difference)

Figure:  $28 \times 28$  pixel image data in MNIST

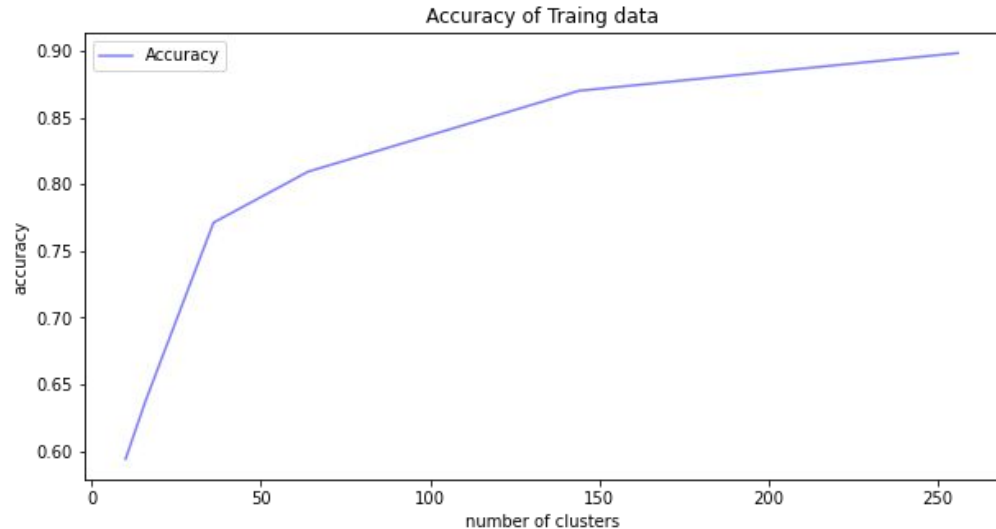

# K-means Clustering based Classifier

- 10 Cluster was not enough, 256 Clusters was acceptable

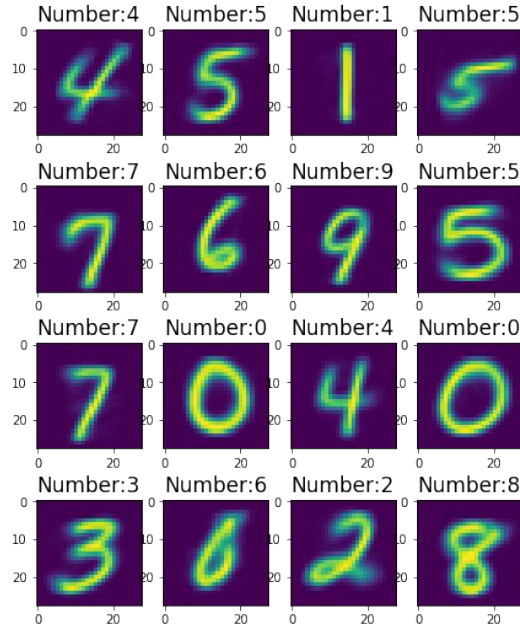

K-means clustering on the digits dataset (PCA-reduced data)  
10 Centroids are marked with white dots

- Accuracy for training data: 0.53
- Accuracy for test data: 0.12

# K-means Clustering based Classifier (Cont.)

16 sample Centroids in 256 Clusters

Clusters differ from :

- Number on the image
- Style (font) of the number

**Performance evaluation (256 clusters):**

<b>Accuracy</b>	<b>0.895</b>
<b>Precision</b>	<b>0.897</b>
<b>Recall</b>	<b>0.893</b>
<b>F1-score</b>	<b>0.894</b>

# K-means Clustering based Classifier (Cont.)

K-means clustering on the digits dataset (PCA-reduced data)  
10 Centroids are marked with white dots

- Accuracy for training data: 0.53
- Accuracy for test data: 0.12

K-means clustering on the digits dataset (PCA-reduced data)  
256 Centroids are marked with white dots

- Accuracy for training data: 0.886
- Accuracy for test data: 0.895

# Strength & Weakness of ML algorithms

Metric	KNN	NN	K-means
Accuracy	0.924	0.802	0.895
Precision	0.93	0.889	0.897
Recall	0.923	0.857	0.893
F1-score	0.924	0.873	0.894

## Strength:

Best performance  
Lowest computation cost

*Likely to be improved when problem become more complicated*

Acceptable performance based on unsupervised learning

## Weakness:

*Likely to be degraded when problem become more complicated*

Worst performance  
Highest computation cost

Difficult to manipulate decision boundaries and set # of clusters  
Sensitive to Outliers

# Lesson Learned

- Neural network is known to be one of the best ML algorithm, but didn't make the best performance in this project
- There is no absolutely superior ML algorithms for all problems
- If you plan to use a ML model, choosing ML algorithm appropriate to the characteristics of the problem is important
- Preprocessing a dataset is as difficult task as making a machine learning model

# Future Work

- Develop a KNN classifier using cosine similarity for the similarity calculation, instead of euclidean distance
- Performance evaluation of the convolutional neural network (CNN) model and the difference between various hyper parameter settings
- Develop a classifier taking advantage of **K-means clustering** and supervised learning algorithm (e.g. **KNN**, Logistic regression) , which performs better than the supervised learning alone.

**Thank you!**
