

Most of the programming assignments in CS 2505 will require using the C language.

We will use a current version of the GCC C compiler.

What's GCC?

- the Gnu Compiler Collection (see gcc.gnu.org)
- a collection of freeware software development tools, including support for C, C++, Objective-C, Fortran, Java, and Ada
- available as part of all Linux and most UNIX-derived operating systems

How do you get it?

- run Linux or a UNIX derivative
- use a remote Linux or UNIX environment

You will have to use the CS Department's rlogin cluster for some assignments in any case.

Read Chapter 1 of the Sobell book for a history of Linux... really...

There are many Linux distributions (distros)... superiority is a matter of religion.

- the CS Department's rlogin cluster (more later) is running CentOS
- I use Ubuntu and Fedora
- as much as possible, CS 2505 will be distro-agnostic

If you are not already running Linux on your own computer, I advise using Ubuntu.

If you are already running Linux, I advise running whichever distro you choose.

Here's my advice:

- Install VirtualBox (virtualbox.org).
 - I used version 4.1.6 (and had issues with 4.1.8).
 - Follow the installation instructions carefully.
- Download a CD/DVD image for installing your chosen distro.
 - I used `ubuntu-11.04-desktop-amd64.iso` (and had issues with 11.10).
 - The installation will be faster if you actually burn a CD/DVD.
- Follow the instructions in the VirtualBox manual:
 - for installing a guest OS on Windows
 - for installing the VirtualBox Guest Additions

Once you're done, you can boot and run Linux within a virtual machine.

This minimizes your chances of disrupting your existing system setup.

This works best if your computer has at least 2GB of RAM.

Essentially, follow the instructions for a Windows Host.

Note:

- OS X is not Linux (or UNIX), and that prior students have experienced issues when trying to use the OS X native version of the GCC C compiler in this course.
- Those problems will go away if you run Linux.
- If you decline to do that, you may have to use the rlogin cluster (more later) for all of the UNIX-related assignments.

You may also install Linux so that you can choose between Linux and Windows when you boot your computer.

The website for your chosen Linux distro will include installation instructions for dual-booting.

This generally works as advertised as long as:

- Your computer does not have any unusual issues, especially with respect to the partitioning of the hard disk.
- You follow the instructions carefully.

That said...

- YMMV.
- Using VirtualBox (or some other virtualization software) allows you to switch seamlessly between your native host OS and Linux.

You may also install Linux so that you can boot it from a CD or a flash drive.

The website for your favorite distro will have instructions for creating a bootable CD installation (often called a Live CD).

This doesn't usually give you the ability to update or save changes.

See pendrivelinux.com for instructions on creating a bootable Linux flash drive.

This generally works as advertised as long as you follow the instructions carefully.

This should pose no risk to your existing machine setup.

That said...

- YMMV.
- With some distros it is allegedly possible to perform updates and save changes. YMMV with this as well.

The CS Department uses a single-logon system (SLO) for many of its resources.

If you are a CS major and have previously taken a CS course at VT, you should already have an account.

If not, or if you've forgotten your SLO password, go to the following link and rectify the problem:

<https://admin.cs.vt.edu/>

Note that you will need this to access some of the resources necessary for this course.

Secure shell is a network protocol for secure communication.

An SSH client is supplied with UNIX/Linux, and with OS X.

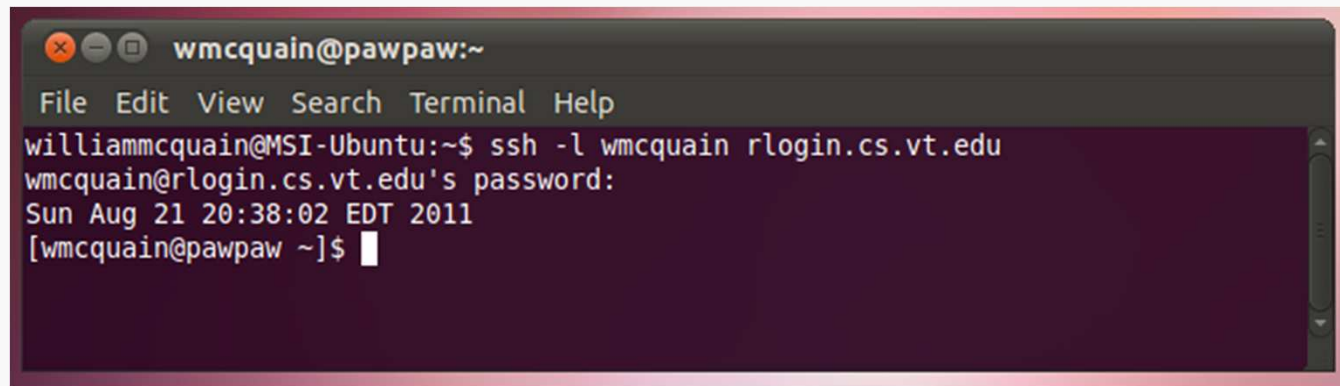

Windows users should Google for “SSH Secure Shell Client” or for “PuTTY”, which are freely available for non-commercial use.

You will use an SSH client to access the rlogin cluster for certain assignments.

The rlogin cluster is a collection of computers, each running CentOS, that are available to for students taking CS courses at VT.

To access the cluster, open a Linux terminal and enter the following command using your VT email PID:

```
ssh -l <PID> rlogin.cs.vt.edu
```

```
wmcquain@pawpaw:~  
File Edit View Search Terminal Help  
williammcquain@MSI-Ubuntu:~$ ssh -l wmcquain rlogin.cs.vt.edu  
wmcquain@rlogin.cs.vt.edu's password:  
Sun Aug 21 20:38:02 EDT 2011  
[wmcquain@pawpaw ~]$
```

SSH: login without a password

You can set up keys that allow you to ssh to your rlogin account without using a password.

From a Linux or Cygwin terminal on your machine, use the ssh-keygen command to create a key pair; the session will resemble this:

```
wmcquain@MSI-Ubuntu~$ ssh-keygen
Generating public/private rsa key pair.
Enter file in which to save the key (/home/wmcquain/.ssh/id_rsa): [Enter key]
Enter passphrase (empty for no passphrase): [Press enter key]
Enter same passphrase again: [Pess enter key]
Your identification has been saved in /home/wmcquain/.ssh/id_rsa.
Your public key has been saved in /home/wmcquain/.ssh/id_rsa.pub.
The key fingerprint is:
33:b3:fe:af:95:95:18:11:31:d5:de:96:2f:f2:35:f9 wmcquain@MSI-Ubuntu
```

Then, use the ssh-copy-id command to install the key on the remote system:

```
wmcquain@MSI-Ubuntu~$ ssh-copy-id -i ~/.ssh/id_rsa.pub rlogin.cs.vt.edu
wmcquain@remote-host's password:
```

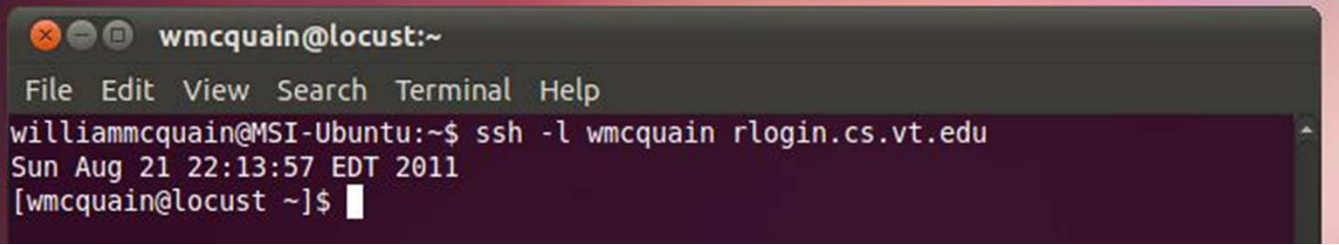

SSH: login without a password

You should now ssh to your rlogin account and see if your key file only contains what you would expect:

```
[wmcquain@hornbeam .ssh]$ cd .ssh
[wmcquain@hornbeam .ssh]$ ls -a
.  ..  authorized_keys  id_rsa  id_rsa.pub  known_hosts
[wmcquain@hornbeam .ssh]$ cat authorized_keys
ssh-rsa <snipped gobbledygook> wmcquain@MSI-Ubuntu
[wmcquain@hornbeam .ssh]$
```

The only authorized key entry corresponds to my login from my local machine.

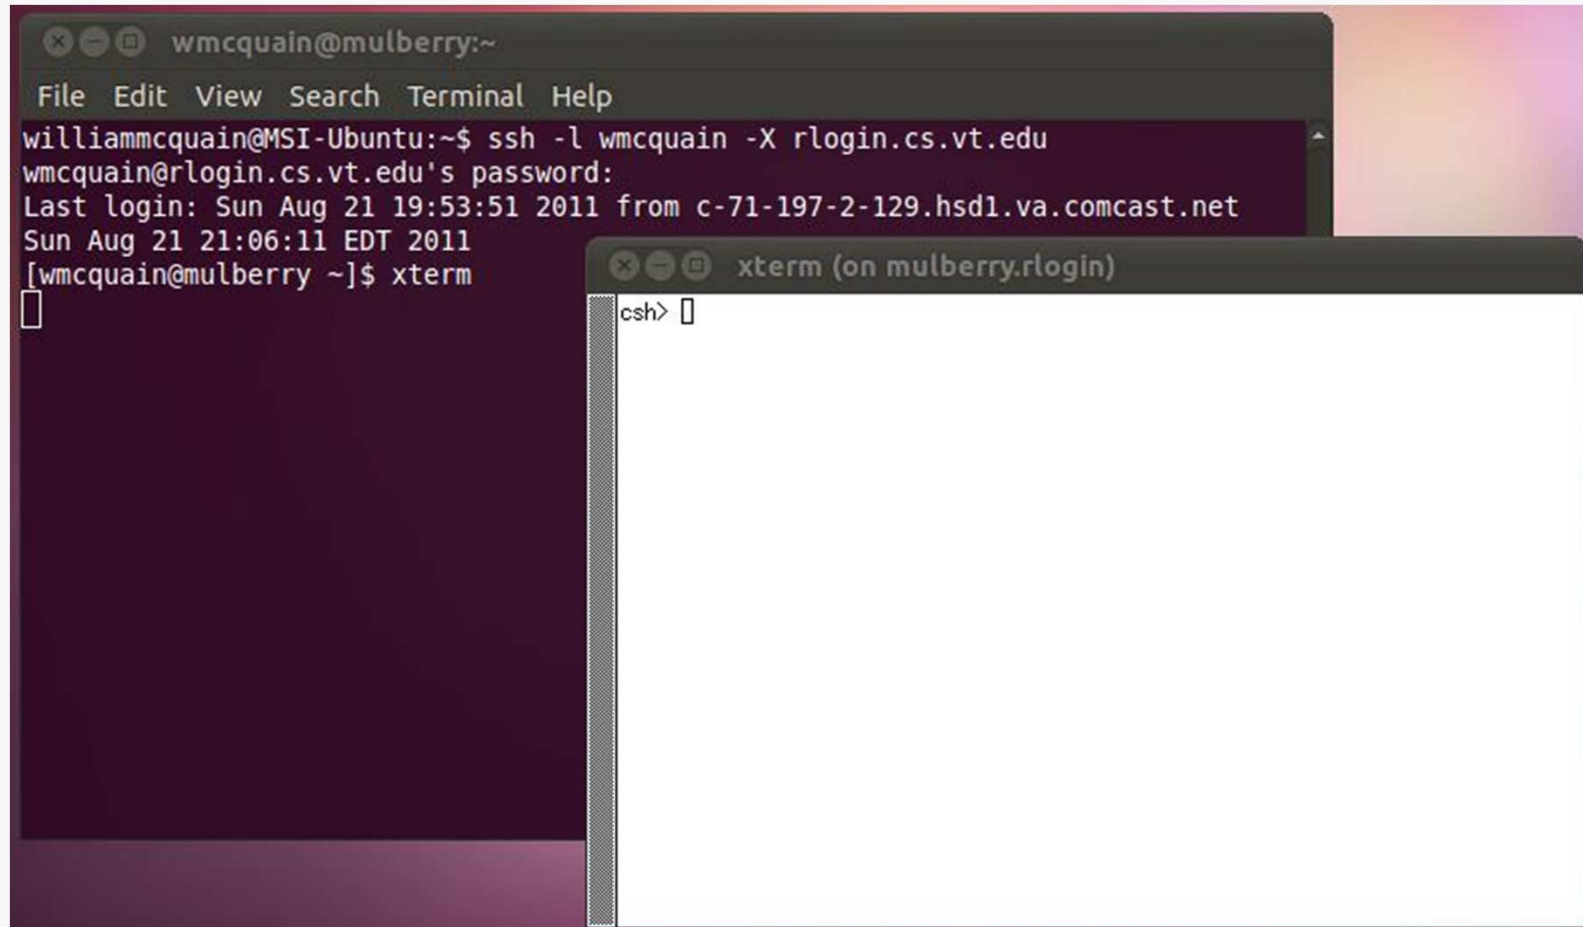

Now, I can ssh to the cluster without having to provide a password:

A terminal window titled 'wmcquain@locust:~' with a menu bar (File, Edit, View, Search, Terminal, Help). The terminal shows the command 'ssh -l wmcquain rlogin.cs.vt.edu' being executed. The output is 'Sun Aug 21 22:13:57 EDT 2011' followed by a prompt '[wmcquain@locust ~]\$' with a cursor.

```
wmcquain@locust:~
File Edit View Search Terminal Help
williammcquain@MSI-Ubuntu:~$ ssh -l wmcquain rlogin.cs.vt.edu
Sun Aug 21 22:13:57 EDT 2011
[wmcquain@locust ~]$
```

SSH: opening an X tunnel

Many Linux applications have a graphical user interface; you can execute those on the server (rlogin cluster machine) by using the `-X` switch when you invoke `ssh`:

```
wmcquain@mulberry:~  
File Edit View Search Terminal Help  
williammcquain@MSI-Ubuntu:~$ ssh -l wmcquain -X rlogin.cs.vt.edu  
wmcquain@rlogin.cs.vt.edu's password:  
Last login: Sun Aug 21 19:53:51 2011 from c-71-197-2-129.hsd1.va.comcast.net  
Sun Aug 21 21:06:11 EDT 2011  
[wmcquain@mulberry ~]$ xterm  
xterm (on mulberry.rlogin)  
csh>
```

Get to work!

Create an installation of Linux on your laptop/tablet.

- Use VirtualBox or not, your choice.
- Use whatever Linux distro you like.

Get an SLO account (if you don't already have one) and make sure you know your password.

Set up password-free login (via ssh) to your `rlogin.cs.vt.edu` account.
