Divide and Conquer Algorithms

T. M. Murali

March 3 and 15, 2016

Divide and Conquer Algorithms

- Study three divide and conquer algorithms:
 - Counting inversions.
 - Finding the closest pair of points.
 - Integer multiplication.
- First two problems use clever conquer strategies.
- ▶ Third problem uses a clever divide strategy.

Motivation

- Collaborative filtering: match one user's preferences to those of other users, e.g., music.
- ► Meta-search engines: merge results of multiple search engines to into a better search result.

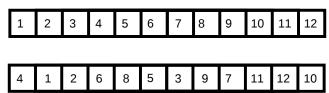

Motivation

- Collaborative filtering: match one user's preferences to those of other users, e.g., music.
- ▶ Meta-search engines: merge results of multiple search engines to into a better search result.
- Fundamental question: how do we compare a pair of rankings?
 - ▶ My ranking of songs: ordered list of integers from 1 to *n*.
 - ▶ Your ranking of songs: $a_1, a_2, ..., a_n$, a permutation of the integers from 1 to n.

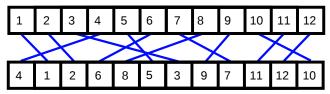

4 1 2 6 8 5 3 9 7 11 12 10

Comparing Rankings

 Suggestion: two rankings of songs are very similar if they have few inversions.

Comparing Rankings

- Suggestion: two rankings of songs are very similar if they have few inversions.
 - ► The second ranking has an inversion if there exist i, j such that i < j but a_i > a_j.
 - ► The number of inversions *s* is a measure of the difference between the rankings.
- ▶ Question also arises in statistics: *Kendall's rank correlation* of two lists of numbers is 1 2s/(n(n-1)).

Counting Inversions

Count Inversions

INSTANCE: A list $L = x_1, x_2, \dots, x_n$ of distinct integers between

1 and *n*.

SOLUTION: The number of pairs $(i, j), 1 \le i < j \le n$ such

 $x_i > x_j$.

Counting Inversions

Count Inversions

INSTANCE: A list $L = x_1, x_2, \dots, x_n$ of distinct integers between

1 and n.

SOLUTION: The number of pairs $(i, j), 1 \le i < j \le n$ such

 $x_i > x_j$.

4 1 2 6 8 5 3 9 7 11 12 10

Counting Inversions

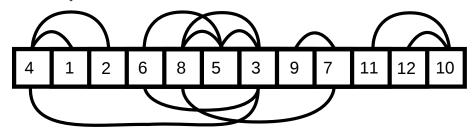

COUNT INVERSIONS

INSTANCE: A list $L = x_1, x_2, \dots, x_n$ of distinct integers between

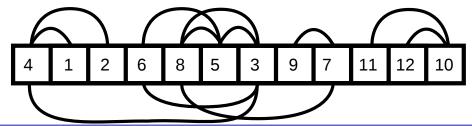

1 and *n*.

SOLUTION: The number of pairs $(i,j), 1 \le i < j \le n$ such

 $x_i > x_j$.

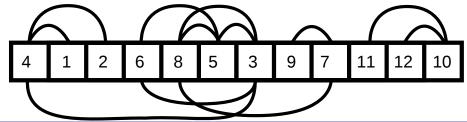

▶ How many inversions can be there in a list of *n* numbers?

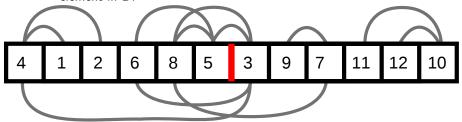

▶ How many inversions can be there in a list of n numbers? $\Omega(n^2)$. We cannot afford to compute each inversion explicitly.

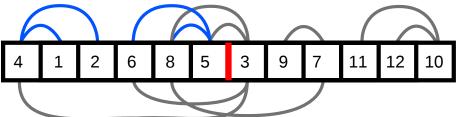

- ▶ How many inversions can be there in a list of n numbers? $\Omega(n^2)$. We cannot afford to compute each inversion explicitly.
- Sorting removes all inversions in $O(n \log n)$ time. Can we modify the Mergesort algorithm to count inversions?

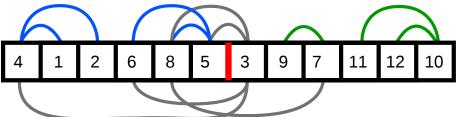

- ▶ How many inversions can be there in a list of n numbers? $\Omega(n^2)$. We cannot afford to compute each inversion explicitly.
- ▶ Sorting removes all inversions in $O(n \log n)$ time. Can we modify the Mergesort algorithm to count inversions?
- Candidate algorithm:
 - 1. Partition L into two lists A and B of size n/2 each.
 - 2. Recursively count the number of inversions in A.
 - 3. Recursively count the number of inversions in B.
 - 4. Count the number of inversions involving one element in *A* and one element in *B*.

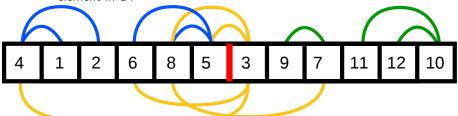

- ▶ How many inversions can be there in a list of n numbers? $\Omega(n^2)$. We cannot afford to compute each inversion explicitly.
- ▶ Sorting removes all inversions in $O(n \log n)$ time. Can we modify the Mergesort algorithm to count inversions?
- Candidate algorithm:
 - 1. Partition L into two lists A and B of size n/2 each.
 - 2. Recursively count the number of inversions in A.
 - 3. Recursively count the number of inversions in *B*.
 - 4. Count the number of inversions involving one element in *A* and one element in *B*.

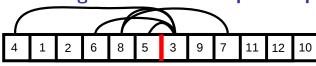

- ▶ How many inversions can be there in a list of n numbers? $\Omega(n^2)$. We cannot afford to compute each inversion explicitly.

 - 3. Recursively count the number of inversions in *B*.
 - 4. Count the number of inversions involving one element in *A* and one element in *B*.

▶ Given lists $A = a_1, a_2, ..., a_m$ and $B = b_1, b_2, ..., b_m$, compute the number of pairs a_i and b_i such $a_i > b_i$.

- ▶ Given lists $A = a_1, a_2, ..., a_m$ and $B = b_1, b_2, ..., b_m$, compute the number of pairs a_i and b_i such $a_i > b_i$.
- ▶ Key idea: problem is much easier if A and B are sorted!

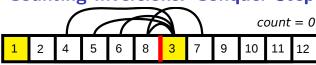

- ▶ Given lists $A = a_1, a_2, ..., a_m$ and $B = b_1, b_2, ..., b_m$, compute the number of pairs a_i and b_j such $a_i > b_j$.
- ▶ Key idea: problem is much easier if A and B are sorted!
- ► MERGE procedure:
 - 1. Maintain a *current* pointer for each list.
 - 3. Initialise each pointer to the front of the list.
 - 4. While both lists are nonempty:
 - 4.1 Let a_i and b_j be the elements pointed to by the *current* pointers.
 - 4.2 Append the smaller of the two to the output list.
 - 4.4 Advance *current* in the list containing the smaller element.
 - 5. Append the rest of the non-empty list to the output.
 - 6. Return the merged list.

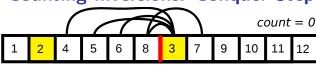

- ▶ Given lists $A = a_1, a_2, ..., a_m$ and $B = b_1, b_2, ..., b_m$, compute the number of pairs a_i and b_j such $a_i > b_j$.
- ▶ Key idea: problem is much easier if A and B are sorted!
- ► MERGE-AND-COUNT procedure:
 - 1. Maintain a *current* pointer for each list.
 - 2. Maintain a variable *count* initialised to 0.
 - 3. Initialise each pointer to the front of the list.
 - 4. While both lists are nonempty:
 - 4.1 Let a_i and b_j be the elements pointed to by the *current* pointers.
 - 4.2 Append the smaller of the two to the output list.
 - 4.3 If $b_i < a_i$, increment *count* by the number of elements remaining in A.
 - 4.4 Advance *current* in the list containing the smaller element.
 - Append the rest of the non-empty list to the output.
 - 6. Return count and the merged list.

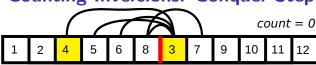

- ▶ Given lists $A = a_1, a_2, ..., a_m$ and $B = b_1, b_2, ..., b_m$, compute the number of pairs a_i and b_j such $a_i > b_j$.

$$T(n) \le 3T(n/2) + cn$$

 $\le O(n^{\log_2 3}) = O(n^{1.59})$

Final Algorithm

```
Recursive-Multiply(x,y):

Write x = x_1 \cdot 2^{n/2} + x_0
y = y_1 \cdot 2^{n/2} + y_0

Compute x_1 + x_0 and y_1 + y_0
p = \text{Recursive-Multiply}(x_1 + x_0, y_1 + y_0)
x_1y_1 = \text{Recursive-Multiply}(x_1, y_1)
x_0y_0 = \text{Recursive-Multiply}(x_0, y_0)
Return x_1y_1 \cdot 2^n + (p - x_1y_1 - x_0y_0) \cdot 2^{n/2} + x_0y_0
```

Computational Geometry

- ▶ Algorithms for geometric objects: points, lines, segments, triangles, spheres, polyhedra, ldots.
- Started in 1975 by Shamos and Hoey.
- ▶ Problems studied have applications in a vast number of fields: ecology, molecular biology, statistics, computational finance, computer graphics, computer vision, . . .

CLOSEST PAIR OF POINTS

INSTANCE: A set *P* of *n* points in the plane

SOLUTION: The pair of points in *P* that are the closest to each other.

- ▶ At first glance, it seems any algorithm must take $\Omega(n^2)$ time.
- ▶ Shamos and Hoey figured out an ingenious $O(n \log n)$ divide and conquer algorithm.

- ▶ Let $P = \{p_1, p_2, ..., p_n\}$ with $p_i = (x_i, y_i)$.
- ▶ Use $d(p_i, p_j)$ to denote the Euclidean distance between p_i and p_j . For a specific pair of points, can compute $d(p_i, p_j)$ in O(1) time.
- ▶ Goal: find the pair of points p_i and p_i that minimise $d(p_i, p_i)$.

- ▶ Let $P = \{p_1, p_2, ..., p_n\}$ with $p_i = (x_i, y_i)$.
- ▶ Use $d(p_i, p_j)$ to denote the Euclidean distance between p_i and p_j . For a specific pair of points, can compute $d(p_i, p_j)$ in O(1) time.
- ▶ Goal: find the pair of points p_i and p_j that minimise $d(p_i, p_j)$.
- ▶ How do we solve the problem in 1D?

- ▶ Let $P = \{p_1, p_2, ..., p_n\}$ with $p_i = (x_i, y_i)$.
- ▶ Use $d(p_i, p_j)$ to denote the Euclidean distance between p_i and p_j . For a specific pair of points, can compute $d(p_i, p_j)$ in O(1) time.
- ▶ Goal: find the pair of points p_i and p_j that minimise $d(p_i, p_j)$.
- ▶ How do we solve the problem in 1D?
 - Sort: closest pair must be adjacent in the sorted order.

- ▶ Let $P = \{p_1, p_2, ..., p_n\}$ with $p_i = (x_i, y_i)$.
- ▶ Use $d(p_i, p_j)$ to denote the Euclidean distance between p_i and p_j . For a specific pair of points, can compute $d(p_i, p_j)$ in O(1) time.
- ▶ Goal: find the pair of points p_i and p_i that minimise $d(p_i, p_i)$.
- ▶ How do we solve the problem in 1D?
 - Sort: closest pair must be adjacent in the sorted order.
 - ▶ Divide and conquer after sorting: closest pair must be closest of
 - 1. closest pair in left half: distance δ_l .
 - 2. closest pair in right half: distance δ_r .
 - 3. closest among pairs that span the left and right halves and are at most $\min(\delta_l, \delta_r)$ apart. How many such pairs do we need to consider?

- ▶ Let $P = \{p_1, p_2, ..., p_n\}$ with $p_i = (x_i, y_i)$.
- ▶ Use $d(p_i, p_j)$ to denote the Euclidean distance between p_i and p_j . For a specific pair of points, can compute $d(p_i, p_j)$ in O(1) time.
- ▶ Goal: find the pair of points p_i and p_j that minimise $d(p_i, p_j)$.
- ▶ How do we solve the problem in 1D?
 - Sort: closest pair must be adjacent in the sorted order.
 - ▶ Divide and conquer after sorting: closest pair must be closest of
 - 1. closest pair in left half: distance δ_l .
 - 2. closest pair in right half: distance δ_r .
 - 3. closest among pairs that span the left and right halves and are at most $\min(\delta_l, \delta_r)$ apart. How many such pairs do we need to consider? Just one!

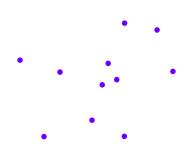

- ▶ Let $P = \{p_1, p_2, ..., p_n\}$ with $p_i = (x_i, y_i)$.
- ▶ Use $d(p_i, p_j)$ to denote the Euclidean distance between p_i and p_j . For a specific pair of points, can compute $d(p_i, p_j)$ in O(1) time.
- ▶ Goal: find the pair of points p_i and p_j that minimise $d(p_i, p_j)$.
- ▶ How do we solve the problem in 1D?
 - Sort: closest pair must be adjacent in the sorted order.
 - ▶ Divide and conquer after sorting: closest pair must be closest of
 - 1. closest pair in left half: distance δ_l .
 - 2. closest pair in right half: distance δ_r .
 - 3. closest among pairs that span the left and right halves and are at most $\min(\delta_l, \delta_r)$ apart. How many such pairs do we need to consider? Just one!
- Generalize the second idea to 2D.

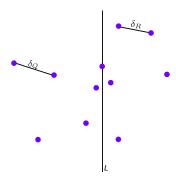

Closest Pair: Algorithm Skeleton

- 1. Divide P into two sets Q and R of n/2 points such that each point in Q has x-coordinate less than any point in R.
- 2. Recursively compute closest pair in Q and in R, respectively.

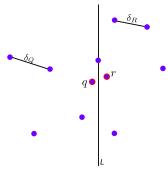

Closest Pair: Algorithm Skeleton

- 1. Divide P into two sets Q and R of n/2 points such that each point in Q has x-coordinate less than any point in R.
- 2. Recursively compute closest pair in Q and in R, respectively.
- 3. Let δ_Q be the distance computed for Q, δ_R be the distance computed for R, and $\delta = \min(\delta_Q, \delta_R)$.

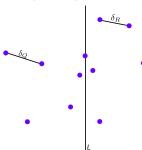

Closest Pair: Algorithm Skeleton

- 1. Divide P into two sets Q and R of n/2 points such that each point in Q has x-coordinate less than any point in R.
- 2. Recursively compute closest pair in Q and in R, respectively.
- 3. Let δ_Q be the distance computed for Q, δ_R be the distance computed for R, and $\delta = \min(\delta_Q, \delta_R)$.
- 4. Compute pair (q, r) of points such that $q \in Q$, $r \in R$, $d(q, r) < \delta$ and d(q, r) is the smallest possible.

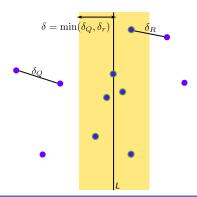

Closest Pair: Proof Sketch

- ▶ Prove by induction: Let (s, t) be the closest pair.
 - (i) both are in Q: computed correctly by recursive call.
 - (ii) both are in R: computed correctly by recursive call.
 - (iii) one is in Q and the other is in R: computed correctly in O(n) time by the procedure we will discuss.
- Strategy: Pairs of points for which we do not compute the distance between cannot be the closest pair.
- ▶ Overall running time is $O(n \log n)$.

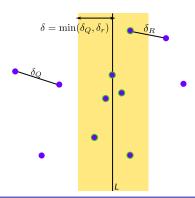

Closest Pair: Conquer Step

- ▶ Line L passes through right-most point in Q.
- ▶ Let S be the set of points within distance δ of L. (In image, $\delta = \delta_R$.)

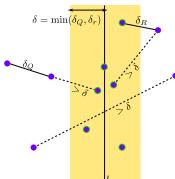

Closest Pair: Conquer Step

- ▶ Line *L* passes through right-most point in *Q*.
- ▶ Let S be the set of points within distance δ of L. (In image, $\delta = \delta_R$.)
- ▶ Claim: There exist $q \in Q$, $r \in R$ such that $d(q, r) < \delta$ if and only if $q, r \in S$.

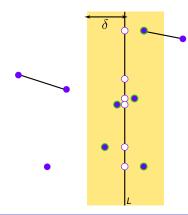

Closest Pair: Conquer Step

- ▶ Line *L* passes through right-most point in *Q*.
- ▶ Let S be the set of points within distance δ of L. (In image, $\delta = \delta_R$.)
- ▶ Claim: There exist $q \in Q$, $r \in R$ such that $d(q, r) < \delta$ if and only if $q, r \in S$.
- ▶ Corollary: If $t \in Q S$ or $u \in R S$, then (t, u) cannot be the closest pair.

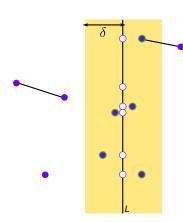

▶ Intuition: "too many" points in S that are closer than δ to each other \Rightarrow there must be a pair in Q or in R that are less than δ apart.

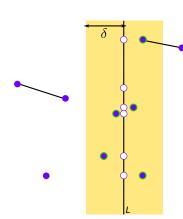

- ▶ Intuition: "too many" points in S that are closer than δ to each other \Rightarrow there must be a pair in Q or in R that are less than δ apart.
- Let S_y denote the set of points in S sorted by increasing y-coordinate and let s_y denote the y-coordinate of a point $s \in S$.

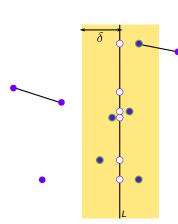

- ▶ Intuition: "too many" points in S that are closer than δ to each other \Rightarrow there must be a pair in Q or in R that are less than δ apart.
- ▶ Let S_y denote the set of points in S sorted by increasing y-coordinate and let s_y denote the y-coordinate of a point $s \in S$.
- ▶ Claim: If there exist $s, s' \in S$ such that $d(s, s') < \delta$ then s and s' are at most 15 indices apart in S_v .

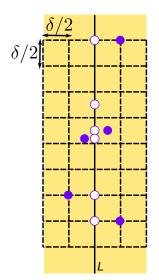

- ▶ Intuition: "too many" points in S that are closer than δ to each other \Rightarrow there must be a pair in Q or in R that are less than δ apart.
- Let S_y denote the set of points in S sorted by increasing y-coordinate and let s_y denote the y-coordinate of a point $s \in S$.
- ▶ Claim: If there exist $s, s' \in S$ such that $d(s, s') < \delta$ then s and s' are at most 15 indices apart in S_y .
- ▶ Converse of the claim: If there exist $s, s' \in S$ such that s' appears 16 or more indices after s in S_y , then $s'_y s_y \ge \delta$.

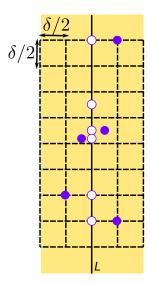

- ▶ Intuition: "too many" points in S that are closer than δ to each other \Rightarrow there must be a pair in Q or in R that are less than δ apart.
- Let S_y denote the set of points in S sorted by increasing y-coordinate and let s_y denote the y-coordinate of a point $s \in S$.
- ▶ Claim: If there exist $s, s' \in S$ such that $d(s, s') < \delta$ then s and s' are at most 15 indices apart in S_y .
- ► Converse of the claim: If there exist $s, s' \in S$ such that s' appears 16 or more indices after s in S_y , then $s'_y s_y \ge \delta$.
- ▶ Use the claim in the algorithm: For every point $s \in S_y$, compute distances only to the next 15 points in S_y .
- Other pairs of points cannot be candidates for the closest pair.

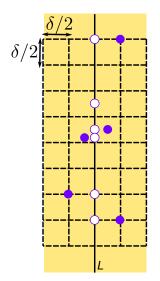

▶ Claim: If there exist $s, s' \in S$ such that s' appears 16 or more indices after s in S_{v} , then $s'_{v} - s_{v} \ge \delta$.

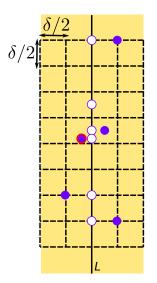

- ▶ Claim: If there exist $s, s' \in S$ such that s' appears 16 or more indices after s in S_{v} , then $s'_{v} s_{v} \ge \delta$.
- Pack the plane with squares of side $\delta/2$.

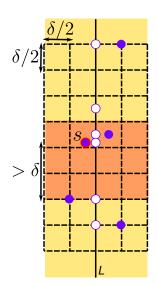

- ▶ Claim: If there exist $s, s' \in S$ such that s' appears 16 or more indices after s in S_{v} , then $s'_{v} s_{v} \ge \delta$.
- ▶ Pack the plane with squares of side $\delta/2$.
- ► Each square contains at most one point.

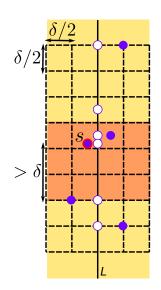

- ▶ Claim: If there exist $s, s' \in S$ such that s' appears 16 or more indices after s in S_{v} , then $s'_{v} s_{v} \ge \delta$.
- Pack the plane with squares of side $\delta/2$.
- Each square contains at most one point.
- Let s lie in one of the squares.

- ▶ Claim: If there exist $s, s' \in S$ such that s' appears 16 or more indices after s in S_{v} , then $s'_{v} s_{v} \ge \delta$.
- ▶ Pack the plane with squares of side $\delta/2$.
- Each square contains at most one point.
- Let s lie in one of the squares.
- Any point in the third row of the packing below s has a y-coordinate at least δ more than s_v .

- ▶ Claim: If there exist $s, s' \in S$ such that s' appears 16 or more indices after s in S_{v} , then $s'_{v} s_{v} \ge \delta$.
- ▶ Pack the plane with squares of side $\delta/2$.
- Each square contains at most one point.
- Let s lie in one of the squares.
- Any point in the third row of the packing below s has a y-coordinate at least δ more than s_y .
- ► We get a count of 12 or more indices (textbook says 16).

Closest Pair: Final Algorithm

```
Closest-Pair(P)
  Construct P_n and P_n (O(n \log n) time)
