

# CS 4604: Introduction to Database Management Systems

*B. Aditya Prakash*

Lecture #7: Entity/Relational  
Model---Part 2

# Announcements

- Homework 2 is out
  - Tricky---so start early!
  - RA/SQL/E-R Models
  - Due next Tuesday Feb 18.
  
- One more thing:
  - **START early!**

# Announcements---Project

- Goal: design a database system application with a web front-end
- Project Assignment 1 will be released next week
  - Total of 3 during the semester
- **Heads-up: Start thinking about groups**
  - same group for rest of the semester
  - You are free to choose your own project members
  - If you like me to assign you to a group, send me email
  - **Min size=2 members, Max size=3 members.** Anything else needs an excellent reason (and my permission)

# How to design E/R models?

# Guidelines

- Be faithful to the specification of the application.
- Avoid redundancy.
- Keep the entities and relationship simple.
- Select the right relationships.
- Select the right type of element.

# Be Faithful to the Specification

- Do not use meaningless or unnecessary attributes
- Define the multiplicity of a relationship appropriately
  - What is the multiplicity of the relationship Take between Students and Courses?
  - What is the multiplicity of the relationship Teach between Professors and Courses?

# Avoid Redundancy

- Redundancy occurs when we express the same fact in two or more ways
- Redundancy wastes space
- Redundancy can lead to inconsistency if we change one instance but not the other

# Select the Right Relationships

- Do not add unnecessary relationships.
- It may be possible to deduce one relationship from another.

# Select the Right Relationships

- Do we need the relationship Instruct between Professors and Students?

# Select the Right Relationships

- Do we need the relationship Instruct between Professors and Students?
  - No! We can deduce it from Take and Teach

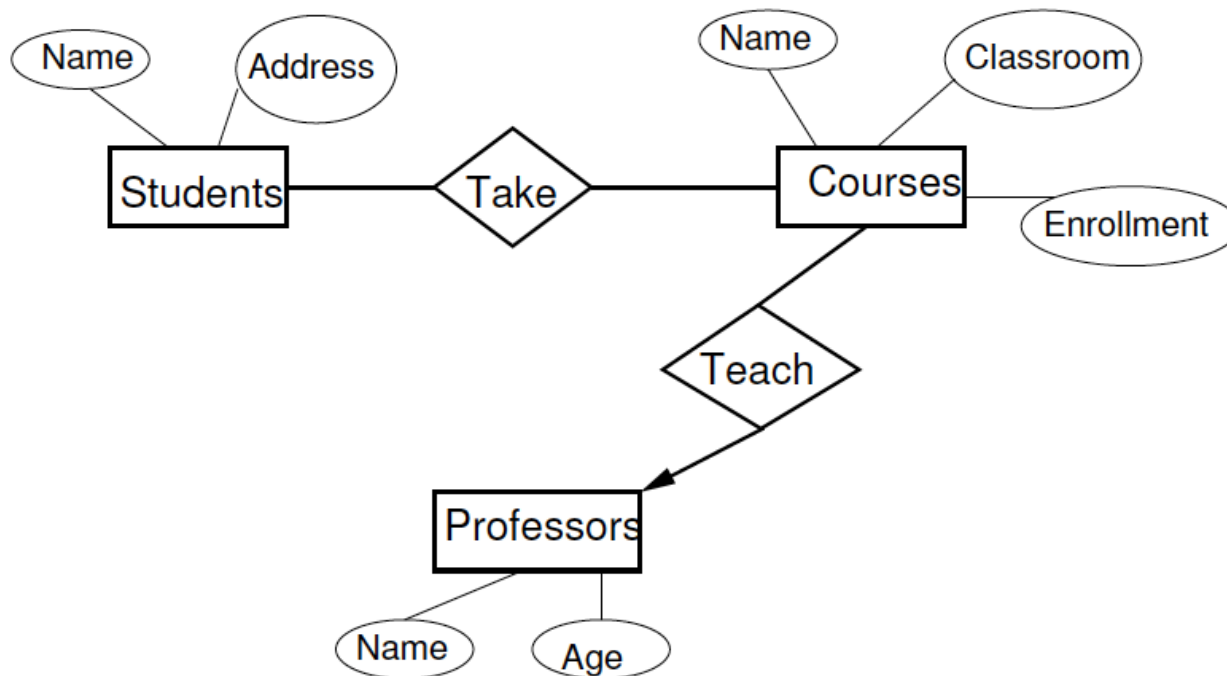

# Select the Right Relationships

- Do we need the relationships Take and Teach?
  - Yes actually. Why?

# Select the right kind of element

- Attribute or Entity or Relationship
- Can we make Professor an attribute of Courses and remove the relationship Teach?

# Select the right kind of element

- Attribute or Entity or Relationship
- What about now?

# Select the right kind of element

- Attribute or Entity or Relationship
- What about now?

Research signifies a research project the student is working on with a professor

# Converting an Entity Set into an Attribute

- **If** an entity set  $E$  satisfies the following properties:
  - All relationships involving  $E$  have arrows entering  $E$
  - The attributes of  $E$  collectively identify an entity (i.e., no attribute depends on another)
  - No relationship involves  $E$  more than once
- **Then** we can replace  $E$  as follows:
  - If there is a many-one relationship  $R$  from an entity set  $F$  to  $E$ , remove  $R$  and make the attributes of  $E$  be attributes of  $F$
  - If there is a multiway relationship  $R$  with an arrow to  $E$ , make  $E$ 's attributes be new attributes of  $R$  and remove the arrow from  $R$  to  $E$

# Types of Constraints

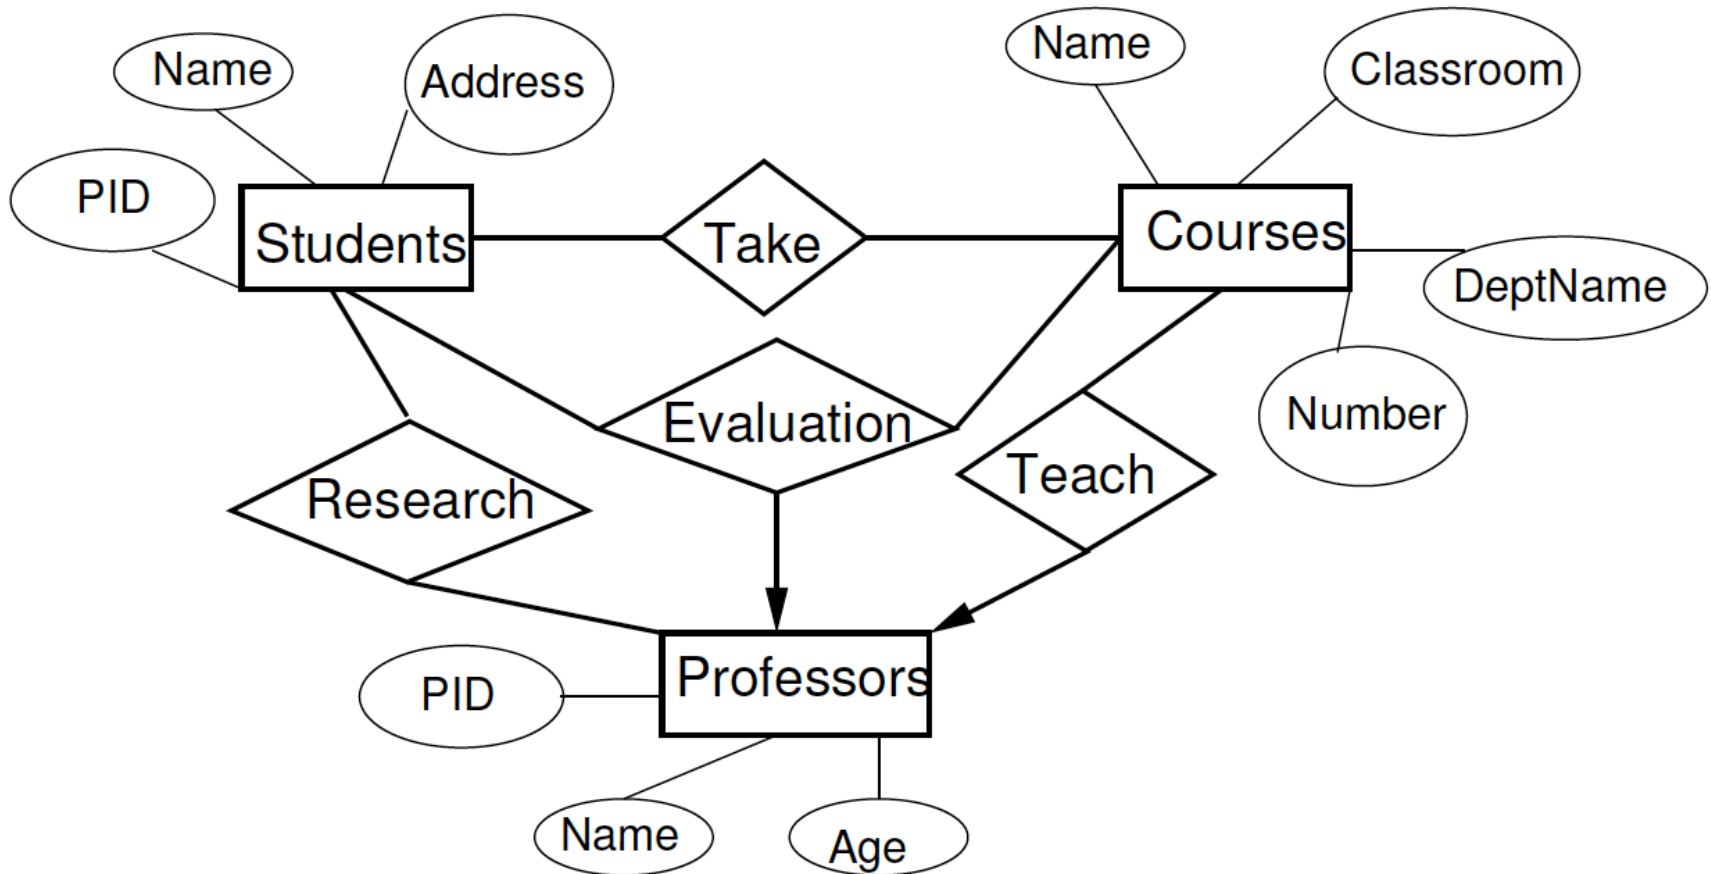

- **Keys** are attributes or sets of attributes that uniquely identify an entity within its entity set.
- **Single-value constraints** require that a value be unique in certain contexts.
- **Referential integrity constraints** require that a value referred to actually exists in the database.
- **Degree constraints** specify what set of values an attribute can take.
- **General constraints** are arbitrary constraints that should hold in the database.
- **Constraints are part of the schema of a database.**

# Keys in the E/R Model

- A key for an entity set  $E$  is a set  $K$  of one or more attributes such that given any two entities  $e_1$  and  $e_2$  in  $E$ ,  $e_1$  and  $e_2$  cannot have identical values for all the attributes in  $K$ .
- $E$  can have multiple keys. We designate one as the primary key.
- In an isa-hierarchy?
  - the root entity set must have all the attributes needed for a key.
- In an E/R diagram, underline the attributes that form the primary key

# Keys: Example

# Keys: Example

# Single Value Constraints

- There is at most one value in a given context
- Each attribute of an entity set has a single value
  - If the value is missing, we can invent a “null” value
  - E/R models cannot represent the requirement that an attribute cannot have a null value
- A many-one relationship implies a single value constraint

# Referential Integrity Constraint

- Asserts that exactly one value exists in a given context
  - Usually used in the context of relationships
- Example: Many-one Advises relationship between Students and Professors
  - Many-one requirement says that no student may have more than one advising professor
  - Referential integrity constraint says that each student must have exactly one advising professor and that professor must be present in the database

# Referential Integrity Constraint

- Asserts that exactly one value exists in a given context
  - Usually used in the context of relationships
- If  $R$  is a (many-to-one or one-to-one) relationship from  $E$  to  $F$ , we use a rounded arrowhead pointing to  $F$  to indicate that we require that the entity in  $F$  related by  $R$  to an entity in  $E$  must exist

# Example: Referential Integrity Constraint

- Each department has at most one chairperson who is its head (there are times when a department may not have a chairperson)
- Each chairperson can be the head of at most one department and this department must exist in the database
- Where do we put arrows?

# Example: Referential Integrity Constraint

- Each department has at most one chairperson who is its head (there are times when a department may not have a chairperson)
- Each chairperson can be the head of at most one department and this department must exist in the database
- Where do we put arrows?

# Enforcing Referential Integrity Constraints

- We forbid the deletion of a referenced entity (e.g., a professor) until the professor advises no students
- We require that if we delete a referenced entity, we delete all entities that reference it
- When we insert a (student, professor) pair into the Advises relationship, the professor must exist in the Professors entity set

# Degree Constraints

- Indicates limits on the # of entities that can be connected
- For example,

- Limits number of stars in each movie to  $\leq 10$

# Degree Constraints

- Indicates limits on the # of entities that can be connected
- So you can think of

- AS

# Weak Entity Sets

- A weak entity set is an entity set whose key contains attributes from one or more other entity sets.
- It is possible that all attributes in a weak entity set's key come from other entity sets.
- Primary causes for weak entity sets:
  - Hierarchy of entity sets (not caused by inheritance).

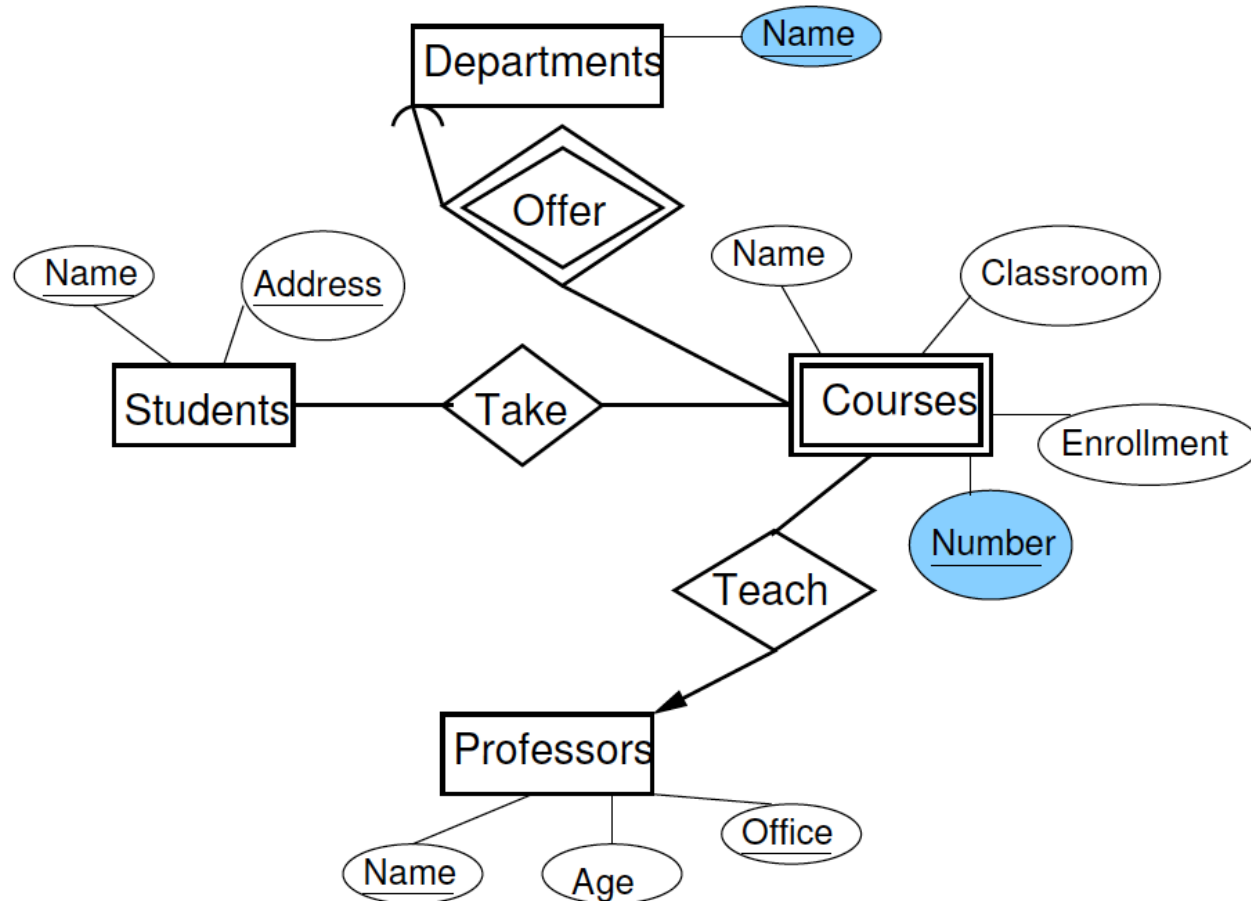

# Example of Weak Entity Set

- Each department teaches multiple courses. Each course has a number. What is the key for the entity set Courses?

# Example of Weak Entity Set

- Each department teaches multiple courses. Each course has a number. What is the key for the entity set Courses?

# Finding the Key for a Weak Entity Set

- E is a weak entity set if its key consists of
  - Zero or more of its own attributes
  - Key attributes from supporting relationships for E
- A relationship R from a weak entity set E to F is supporting if
  - R is a binary, many-one relationship from E to F
  - R has referential integrity from E to F

# Finding the Key for a Weak Entity Set contd...

- How does F help E?
  - F supplies its key attributes to define E's key
  - If F is itself a weak entity set, some of its key attributes come from entity sets to which F is connected by supporting relationships
- Representation in the E/R diagram
  - Weak entity set: rectangle with a double border
  - Supporting relationship: diamond with a double border
